ACETYL 2-HYDROXY-1, 3-DIAMINOALKANES

BACKGROUND OF THE INVENTIONField of the Invention

The invention relates to acetyl 2-hydroxy-1,3-
5 diaminoalkanes and to such compounds that are useful in the
treatment of Alzheimer's disease and related diseases. More
specifically, it relates to such compounds that are capable of
inhibiting beta-secretase, an enzyme that cleaves amyloid
precursor protein to produce amyloid beta peptide (A beta), a
10 major component of the amyloid plaques found in the brains of
Alzheimer's sufferers.

Background of the Invention

Alzheimer's disease (AD) is a progressive degenerative
disease of the brain primarily associated with aging.
15 Clinical presentation of AD is characterized by loss of
memory, cognition, reasoning, judgment, and orientation. As
the disease progresses, motor, sensory, and linguistic
abilities are also affected until there is global impairment
of multiple cognitive functions. These cognitive losses occur
20 gradually, but typically lead to severe impairment and
eventual death in the range of four to twelve years.

Alzheimer's disease is characterized by two major
pathologic observations in the brain: neurofibrillary tangles
and beta amyloid (or neuritic) plaques, comprised
25 predominantly of an aggregate of a peptide fragment know as A
beta. Individuals with AD exhibit characteristic beta-amyloid
deposits in the brain (beta amyloid plaques) and in cerebral
blood vessels (beta amyloid angiopathy) as well as
neurofibrillary tangles. Neurofibrillary tangles occur not
30 only in Alzheimer's disease but also in other dementia-
inducing disorders. On autopsy, large numbers of these
lesions are generally found in areas of the human brain
important for memory and cognition.

Smaller numbers of these lesions in a more restricted
35 anatomical distribution are found in the brains of most aged

humans who do not have clinical AD. Amyloidogenic plaques and vascular amyloid angiopathy also characterize the brains of individuals with Trisomy 21 (Down's Syndrome), Hereditary Cerebral Hemorrhage with Amyloidosis of the Dutch-Type (HCHWA-D), and other neurodegenerative disorders. Beta-amyloid is a defining feature of AD, now believed to be a causative precursor or factor in the development of disease. Deposition of A beta in areas of the brain responsible for cognitive activities is a major factor in the development of AD. Beta-amyloid plaques are predominantly composed of amyloid beta peptide (A beta, also sometimes designated betaA4). A beta peptide is derived by proteolysis of the amyloid precursor protein (APP) and is comprised of 39-42 amino acids. Several proteases called secretases are involved in the processing of APP.

Cleavage of APP at the N-terminus of the A beta peptide by beta-secretase and at the C-terminus by one or more gamma-secretases constitutes the beta-amyloidogenic pathway, i.e. the pathway by which A beta is formed. Cleavage of APP by alpha-secretase produces alpha-sAPP, a secreted form of APP that does not result in beta-amyloid plaque formation. This alternate pathway precludes the formation of A beta peptide. A description of the proteolytic processing fragments of APP is found, for example, in U.S. Patent Nos. 5,441,870; 5,721,130; and 5,942,400.

An aspartyl protease has been identified as the enzyme responsible for processing of APP at the beta-secretase cleavage site. The beta-secretase enzyme has been disclosed using varied nomenclature, including BACE, Asp, and Memapsin. See, for example, Sinha et al., 1999, *Nature* 402:537-554 (p501) and published PCT application WO00/17369.

Several lines of evidence indicate that progressive cerebral deposition of beta-amyloid peptide (A beta) plays a seminal role in the pathogenesis of AD and can precede cognitive symptoms by years or decades. See, for example,

Selkoe, 1991, *Neuron* 6:487. Release of A beta from neuronal cells grown in culture and the presence of A beta in cerebrospinal fluid (CSF) of both normal individuals and AD patients has been demonstrated. See, for example, Seubert et al., 1992, *Nature* 359:325-327.

It has been proposed that A beta peptide accumulates as a result of APP processing by beta-secretase, thus inhibition of this enzyme's activity is desirable for the treatment of AD. In vivo processing of APP at the beta-secretase cleavage site is thought to be a rate-limiting step in A beta production, and is thus a therapeutic target for the treatment of AD. See for example, Sabbagh, M., et al., 1997, *Alz. Dis. Rev.* 3, 1-19.

BACE1 knockout mice fail to produce A beta, and present a normal phenotype. When crossed with transgenic mice that over express APP, the progeny show reduced amounts of A beta in brain extracts as compared with control animals (Luo et al., 2001 *Nature Neuroscience* 4:231-232). This evidence further supports the proposal that inhibition of beta-secretase activity and reduction of A beta in the brain provides a therapeutic method for the treatment of AD and other beta amyloid disorders.

At present there are no effective treatments for halting, preventing, or reversing the progression of Alzheimer's disease. Therefore, there is an urgent need for pharmaceutical agents capable of slowing the progression of Alzheimer's disease and/or preventing it in the first place.

Compounds that are effective inhibitors of beta-secretase, that inhibit beta-secretase-mediated cleavage of APP, that are effective inhibitors of A beta production, and/or are effective to reduce amyloid beta deposits or plaques, are needed for the treatment and prevention of disease characterized by amyloid beta deposits or plaques, such as AD.

5 The invention provides compounds of formula (I), and the other formulas contained herein, that are useful in treating and preventing Alzheimer's disease. The compounds of the invention can be prepared by one skilled in the art based only on knowledge of the compound's chemical structure. The chemistry for the preparation of the compounds of this
10 invention is known to those skilled in the art. In fact, there is more than one process to prepare the compounds of the invention. Specific examples of methods of preparation can be found in the art. For examples, see *J. Org. Chem.* **1998**, 63, 4898-4906; *J. Org. Chem.* **1997**, 62, 9348-9353; *J. Org. Chem.*

20 An example of one of many various processes that can be used to prepare the compounds of the invention is set forth in Scheme I.

Scheme I

where R_1 , X, and Z are as defined above or below.

Scheme I illustrates the preparation of compounds wherein R_c is an isothiochroman 2,2-dioxide using an optionally substituted benzoic acid as the starting material. One of skill in the art will recognize that optionally substituted benzyl halides or benzyl alcohols may also be used as starting materials.

In Scheme I, the benzoic acid is reduced to a benzyl alcohol, which is then converted into a benzyl halide. Alternatively, the benzyl alcohol may be modified to include a leaving group such as, for example, a tosylate, brosylate, nosylate, triflate or mesylate. The benzyl compound is then reacted with a sulfide to generate the thioether. The carboxylic ester is then hydrolyzed to form a carboxylic acid, which is then subjected to annulation reaction conditions to form the desired bicyclic ring system. The annulation can be carried out using a Lewis acid, polyphosphoric acid, or P_2O_5 . Other suitable reagents that effect cyclization are known in the art.

The resulting bicyclic sulfide is oxidized to form the sulfone. The keto group is converted into an amine directly via reductive amination or indirectly through the generation of an oxime, which is then reduced to form the amine.

5 Transition metal catalysts and hydrogen or other reducing agents, such as NaBH_4 , LiAlH_4 or NaCNBH_3 , may be used to effect the reduction.

The resulting amine is used to open the epoxide to form the resulting coupled product. The coupled product is then
10 deprotected to form a free amine, which is acylated or sulfonylated to generate the desired final product. In Scheme I, the use of a Boc protecting group is illustrated, but one of skill in the art will appreciate that other protecting groups, such as CBz, benzyl or others can also be used.

15

Scheme II

Scheme II illustrates the introduction of a non-hydrogen R_{15} group on the 3-position nitrogen atom in the 1,3-diaminopropane portion of the molecule. The free nitrogen is
20 reacted with an electrophile, an aldehyde or ketone and a reducing agent, an acid chloride, an acid anhydride or an acid with a coupling agent, such as DCC (dicyclohexyl carbodiimide), DIC (1,3 diisopropyl carbodiimide), EDCI (1-ethyl-3-(3'-dimethylaminopropyl)carbodiimide hydrochloride),
25 BBC (1-benzotriazol-1-yloxy-bis(pyrrolidino)uronium hexafluorophosphate), BDMP (5-(1H-benzotriazol-1-yloxy)-3,4-

dihydro-1-methyl 2*H*-pyrrolidium hexachloroantimonate), BOMI

 is O-(7-azabenzotriazol-1-yl)- 1,1,3,3-
 bis(pentamethylene)uronium tetrafluoroborate, AOP (O-(7-
 10 azabenzotriazol-1-yl)-tris(dimethylamino)phosphonium
 hexafluorophosphate), BDP (benzotriazol-1-yl diethyl
 phosphate), BOP (1-
 benzotriazolyoxytris(dimethylamino)phosphonium
 hexafluorophosphate), PyAOP (7-
 15 azobenzotriazolyoxytris(pyrrolidino)phosphonium
 hexafluorophosphate), PyBOP (1-
 benzotriazolyoxytris(pyrrolidino)phosphonium
 hexafluorophosphate), TDBTU (2-(3,4-dihydro-4-oxo-1,2,3-
 benzotriazin-3-yl)-1,1,3,3-tetramethyluronium
 20 tetrafluoroborate), TNTU (2-(5-norbornene-2,3-dicarboximido)-
 1,1,3,3-tetramethyluronium tetrafluoroborate), TPTU (2-(2-oxo-
 1(2*H*)-pyridyl-1,1,3,3-tetramethyluronium tetrafluoroborate),
 TSTU (2-succinimido-1,1,3,3-tetramethyluronium
 tetrafluoroborate), BEMT (2-bromo-3-ethyl-4-methyl thiazolium
 25 tetrafluoroborate), BOP-Cl (bis(2-oxo-3-
 oxazolidinyl)phosphinic chloride), BroP
 (bromotris(dimethylamino)phosphonium hexafluorophosphate),
 BTFFH (bis(tetramethylenefluoroformamidinium)
 hexafluorophosphate), ClP (2-chloro-1,3-
 30 dimethylimidazolidinium hexafluorophosphate), DEPBT (3-
 (diethoxyphosphoryloxy)-1,2,3-benzotriazin-4(3*H*)-one), Dpp-Cl
 (diphenylphosphinic chloride), EEDQ (2-ethoxy-1-
 ethoxycarbonyl-1,2-dihydroquinoline), FDPP (pentafluorophenyl
 diphenylphosphinate), HOTT (*S*-(1-oxido-2-pyridinyl)-1,1,3,3-
 35 tetramethylthiuronium hexafluorophosphate), PyBroP

(bromotris(pyrrolydino)phosphonium hexafluorophosphate), PyCloP (chlorotris(pyrrolydino)phosphonium hexafluorophosphate), TFFH (tetramethylfluoroformamidinium hexafluorophosphate), and TOT (S-(1-oxido-2-pyridinyl)-1,1,3,3-tetramethylthiouronium

5 tetrafluoroborate) to generate the monosubstituted product, which can then be deprotected and coupled to the "X-Z" group. Conversely, the monosubstituted product can be deprotected, and the free nitrogen reacted with an electrophile, an aldehyde or ketone and a reducing agent, an acid chloride, an
10 acid anhydride or an acid with a coupling agent, such as those previously exemplified to generate the disubstituted product, which is then coupled to the "X-Z" group.

Scheme III

15

Scheme III illustrates the introduction of a tertiary amine (R is not hydrogen) or a secondary amine (R is hydrogen) onto the isothiochroman 2,2-dioxide scaffold. First, the sulfo-ketone is alkylated using, for example, a Grignard reagent or other alkylating agent, to generate the tertiary alcohol, which is then converted into a leaving group. One of skill in the art will appreciate that many possible leaving groups may be used. Particular examples include, but are not limited to triflate, mesylate, paratoluene sulfonate, nosylate, and brosylate. The leaving group is then displaced using an azide, such as DPPA or NaN₃. Substituted azides may be used in place of the unsubstituted azide. Alternatively, the desired compounds can be generated from the alcohol
20
25

directly without first converting the alcohol into a leaving group. Such transformations can be readily accomplished using conventional SN_1 conditions according to procedures available in the literature.

5 The resulting azide is then reduced to generate the desired amine. Many reducing agents that will effect the desired transformation are known. Examples include H_2 and Pd, H_2 and Pt, $NaBH_4$, and $NaCNBH_3$. Stronger reducing agents, such as $LiAlH_4$ and DIBAL may be used, but the sulfone may also be reduced. If the sulfone is reduced, it may be reoxidized using methods known in the art, such as MCPBA.

Scheme IV

15 As shown in scheme IV, spirocycles may be generated by alkylating a compound in the presence of a strong base. Examples of strong bases include, LDA, KHMDS, and tertiary-butyl lithium. One of skill in the art will appreciate that many other bases are strong enough to deprotonate the starting material and effect the desired transformation.

20 The alkylating agent dictates the size of the spirocycle that is formed. Dibromo ethane, diiodoethane, or bromo iodoethane will generate a spirocyclopropyl compound, wherein n is 1. However, longer alkyl chains generate larger spirocycloalkyl compounds. For example, a 1,5-dihalopentane generates a spirocyclohexyl compound, wherein n is 4. Although dihalo compounds are illustrated, one of skill in the art will appreciate that other leaving groups, such as, for example, mesylate, tosylate, triflate, brosylate, and nosylate
30 may be used. The leaving groups may, but need not, be identical.

Scheme V: Preparation of Fluorene Derivatives

Scheme V illustrates the preparation of fluorene derivatives using optionally substituted salicylic esters as starting materials. Non-commercially available substituted salicylic esters may be obtained by a variety of methods well known to those skilled in the art of organic synthesis. Such methods include, but are not limited to, halogenations [Rozen and Lerman (J. Org. Chem. **1993**, 239 - 240)], Suzuki couplings [Miyaura and Suzuki (Chem. Rev. **1995**, 2457 - 2483)], Sonagashiri couplings [Sonagashira (Metal-Catalyzed Cross-Coupling Reactions, **1998**, Wiley-VCH publishers)], Negishi couplings [Zhu, et al. (J. Org. Chem. **1991**, 1445 - 1453)], Stille cross-couplings [Littke et al. (Angew. Chem. Int. Ed. **1999**, 2411 - 2413)], Heck couplings [Whitcombe et al. (Tetrahedron **2001**, 7449 - 7476)], aminations [Wolfe et al. (J. Org. Chem. **2000**, 1144 - 1157)], oxygenations [Fu and Littke (Angew. Chem. Int. Ed. **2002**, 4177 - 4211)] and carbonylations [Cai et al. (J Chem Soc, Perkin Trans 1 **1997**, 2273 - 2274)]. One of skill in the art will recognize that optionally substituted ortho halo benzoates may also be used as starting materials.

Alternately, the carboxylic acid may be cyclized through the intermediacy of the corresponding activated acid as taught by Alder, *et al* (Justus Liebigs Ann. Chem. **1950**; 230 - 238) Stiles and Libbey (J. Org. Chem **1957**, 1243 - 1245) and Ladd, *et al*. (J. Med. Chem. **1986** 1904 -1912).

The ketone may be converted to the corresponding oxime. The condensation reaction is carried out in the presence of a hydroxylamine (of the general formula RONH_2 ; where $\text{R} = \text{H}$, $\text{C}_1\text{-C}_4$) with or without a base in an inert solvent. Scheme VI

Scheme VI

As described above and below, one aspect of the invention provides for compounds of formula (11) as shown above. These compounds may be made by methods known to those skilled in the art from starting compounds that are also known to those skilled in the art. The process chemistry is further well known to those skilled in the art. A suitable process for the preparation of compounds of formula (11) is set forth in Scheme VI above.

Scheme VI illustrates the preparation of the desired compounds using the readily obtainable 6-iodo-chroman-4-ol (6) as a starting material (see *Synthesis*, 1997, 23-25). One skilled in the art will recognize that there are several methods for the conversion of the alcohol functionality to the desired amino compounds of formula (7). In Scheme VI the alcohol (6) is first activated with methane sulfonyl chloride and the resulting mesylate displaced with sodium azide NaN₃. Alternative methods for the conversion of an alcohol to an azide are well known to one skilled in the art. The resulting

azide is subsequently reduced using trimethylphosphine in a mixture of THF and water. One skilled in the art will recognize that there are several methods for the reduction of an azide to the corresponding amine. For examples, see
5 Larock, R.C. in *Comprehensive Organic Transformations*, Wiley-VCH Publishers, 1999. This reduction of the azide produces a mixture of enantiomers of the amine (7). This enantiomeric mixture can be separated by means known to those skilled in the art such as low temperature recrystallization of a chiral
10 salt or by chiral preparative HPLC, most preferably by HPLC, employing commercially available chiral columns.

The resulting amine (7) is used to open the epoxide (8) to afford the protected (6-iodo-3,4-dihydro-2H-chromen-4-yl)amino propyl carbamate (9). Suitable reaction conditions
15 for opening the epoxide (8) include running the reaction in a wide range of common and inert solvents. C₁-C₆ alcohol solvents are preferred and isopropyl alcohol most preferred. The reactions can be run at temperatures ranging from 20-25 °C up to the reflux temperature of the alcohol employed. The
20 preferred temperature range for conducting the reaction is between 50°C and the refluxing temperature of the alcohol employed.

The protected iodo-chromen (9) is deprotected to the corresponding amine by means known to those skilled in the art
25 for removal of amine protecting groups. Suitable means for removal of the amine protecting group depend on the nature of the protecting group. Those skilled in the art, knowing the nature of a specific protecting group, know which reagent is preferable for its removal. For example, it is preferred to
30 remove the preferred protecting group, BOC, by dissolving the protected iodo-chroman in a trifluoroacetic acid/dichloromethane (1/1) mixture. When complete the solvents are removed under reduced pressure to give the corresponding amine (as the corresponding salt, i.e. trifluoroacetic acid salt)
35 which is used without further purification. However, if

desired, the amine can be purified further by means well known to those skilled in the art, such as for example recrystallization. Further, if the non-salt form is desired that also can be obtained by means known to those skilled in the art, such as for example, preparing the free base amine via treatment of the salt with mild basic conditions. Additional BOC deprotection conditions and deprotection conditions for other protecting groups can be found in T. W. Green and P. G. M. Wuts in *Protecting Groups in Organic Chemistry*, 3rd edition, John Wiley and Sons, 1999.

The amine is then reacted with an appropriately substituted amide forming agent Z-(CO)-Y to produce coupled amides (10) by nitrogen acylation means known to those skilled in the art. Nitrogen acylation conditions for the reaction of amine with an amide forming agent Z-(CO)-Y are known to those skilled in the art and can be found in R.C. Larock in *Comprehensive Organic Transformations*, VCH Publishers, 1989, p. 981, 979, and 972. Y comprises -OH (carboxylic acid) or halide (acyl halide), preferably chlorine, imidazole (acyl imidazole), or a suitable group to produce a mixed anhydride.

The acylated iodo-chromen (10) is coupled with an appropriately functionalized organometallic R₂₀₀M to afford compounds of formula (11) using conditions known to those skilled in the art. One skilled in the art will recognize that there are several methods for coupling various alkyl and aryl groups to an aromatic iodide. For examples, see L. S. Hegedus *Transition Metals in the Synthesis of Complex Organic Molecules*, University Science, 1999.

Scheme VII

Scheme VII sets forth alternative routes to 4-aminochromanes, which are useful for preparing compounds of formula (11). Amines of formula (16) can be prepared by coupling the appropriately functionalized organometallic to 6-iodo-chroman-4-ol (12) or to the appropriately protected iodo-amino chroman of the formula (14). Further elaboration of the coupled products using methods known to one of skill in the art, ultimately yields the desired amines of formula (16). The chemistry from this point forward follows the generalizations described in Scheme VIII for converting compound 9 to 10.

15 Scheme VIII

Scheme VIII illustrates another general preparation of amines of formula (9) that upon following the generalizations outlined in Schemes VI and VII will result in compounds of the

formula (10). From this point forward, the chemistry is essentially the same as described for Schemes VI and VII.

The compounds of the invention that comprise tetrahydroquinoline moieties can be made by methods known in the art. The following general scheme can also be useful for tetrahydroquinoline compound synthesis.

5

Description of general synthetic scheme

Aniline TQ-1 is alkylated with a halide TQ-2B or acrylate TQ-2A to give TQ-3. TQ-3 is then treated with a strong acid or with a Lewis acid at temperatures ranging from 0 °C to 140 °C, preferably with phosphorus pentoxide and methanesulfonic acid at 130 °C, to give ketone TQ-4. The nitrogen of TQ-4 is

then either protected with a protecting group, many of which are listed in Protective Groups in Organic Synthesis, Greene and Wuts, 3rd edition, 1999, Wiley-Interscience, or is substituted with an alkyl group, an acyl group, or a sulfonyl group, using methods well known to those versed in the art, using R-Z, to give protected ketone TQ-5. An alternative preparation of TQ-5 starts with TQ-4 where R' is hydrogen. Halogenation with halogenating reagents such as N-bromosuccinimide, N-iodosuccinimide, dibromatin, and the like gives TQ-4a where R' is preferably bromine or iodine. Treatment of TQ-4a under cross coupling conditions such as those described by Negishi (Tet. Lett. 1983, 3823), Huo (Org. Lett. 2003, 423) and reviewed by Knochel (Tetrahedron 1998, 8275) provides TQ-4b where R' is alkyl. Further treatment of TQ-4b with R-Z as described above gives TQ-5.

Protected ketone TQ-5 is then converted to amine TQ-7 by several methods, the choice of which may depend on the nature of the R group. In the first method, TQ-5 is treated with a hydroxyl amine in the presence of a base and a catalytic amount of acid in solvents such as methanol, ethanol, butanol, and the like, at temperatures ranging from room temperature to the reflux temperature of the solvent, to give oxime TQ-6. TQ-6 is then reduced to amine TQ-7 using a suitable catalyst, preferably palladium, in solvents such as methanol, ethanol, or ethyl acetate, under a blanket of hydrogen at pressures ranging from atmospheric to 100 pounds per square inch. Alternatively, protected ketone TQ-5 is reduced to alcohol TQ-8 using reducing agents known to those well versed in the art, preferably and depending on the nature of group R using sodium borohydride in methanol or ethanol at temperatures ranging from 0 to 100 °C. Alcohol TQ-8 is then converted to sulfonate ester TQ-9 with reagents such as methanesulfonyl chloride or toluenesulfonyl chloride using methods known to those well-versed in the art. Displacement of the sulfonate ester with azide using, for example, sodium azide in solvents such as

dichloromethane and DMF at temperatures ranging from room temperature to 120 °C, gives azide TQ-10. Azide TQ-10 is then reduced to amine T-7 using, for example, trimethylphosphine in solvents such as THF and the like at temperatures between 0 °C to the reflux temperature of the solvent. Other methods of reduction of the azide group are known; the choice of reducing agent will depend on the nature of the R and R' groups and will be known to those well versed in the art and can be found in references such as Smith and March, March's Advanced Organic Chemistry: Reactions, Mechanisms, and Structure, 5th ed., 2001, Wiley-Interscience. Amine TQ-7 is then stirred in the presence of epoxide TQ-11 in preferably, but not limited to, alcoholic solvents such as ethanol, isopropyl, tert-butyl, or n-butyl alcohol, at temperatures ranging from 50 °C to the reflux temperature of the solvent, to give Boc-amine TQ-12. Boc-amine TQ-12 is then treated with strong acid such as trifluoroacetic acid in non-reactive solvents such as dichloromethane or with dry HCl in solvents such as dialkyl ethers or alcoholic solvents at temperatures ranging from room temperature to 80 °C to give, after washing with base, triamine TQ-13. Triamine TQ-13 is acylated by means well-known to those versed in the art, for example condensation with a carboxylic acid using coupling agents such as EDC, DCC, HATU, or HBTU and the like. Preferred methods are acylation with acyl imidazole or acetylation with N, N-diacetylmethoxyamine to give TQ-14.

Experimental Procedures

30 **Example 1:** Preparation of 7-Bromo-1-tetralone

7-bromo-1-tetralone was prepared according to the procedure described in Cornelius, L. A.M.; Combs, D. W. *Synthetic Communications* 1994, 24, 2777-2788. The above isomers were separated using silica gel flash chromatography (Biotage Flash 75, elution solvent 20/1 hexanes:MTBE) to yield 5-bromo-1-tetralone (11.59 g, 51%) and 7-bromo-1-tetralone (9.45 g, 42%).

Tetralin-1-ol compounds may be prepared as shown in Example 2 below. More specifically, (R)-7-ethyltetralin-1-ol was prepared in three steps starting from 7-ethyl-1-tetralone. The first step involves an asymmetric reduction of the ketone using borane and Corey's oxazaborolidine chiral auxiliary. This reduction produced a 97:3 mixture of (presumably) R/S enantiomers. A Mitsunobu-like S_N2 conversion to the azide and LiAlH_4 reduction to the amine produced material 98:2 S/R.

Example 2: Preparation of (R)-7-Ethyltetralin-1-ol

See generally: Jones, T. K.; Mohan, J. J.; Xavier, L. C.; Blacklock, T. J.; Mathre, D. J.; Sohar, P.; Turner-Jones, E. T.; Reamer, R. A.; Roberts, F. E.; Grabowski, E. J. J. *J. Org. Chem.* 1991, 56, 763-769. More particularly, 7-ethyl-1-tetralone (2.29 g, 13.1 mmol) was placed in a 100 mL round bottomed flask and dissolved in anhydrous THF (40 mL). Activated 4Å molecular sieves were added and the mixture was aged for 2 h before transferring via cannula to a 250 mL three-necked round bottom flask fitted with a dropping funnel, thermometer, and a nitrogen inlet. The solution was cooled to -25°C and 1M (S)-tetrahydro-1-methyl-3,3-diphenyl-1H,3H-pyrrolo[1,2-c][1,3,2]oxazaborole in toluene (1.3 mL, 1.3 mmol) was added. The source of the oxazaborole was Aldrich, cat.

no. 45,770-1, "(S)-2-methyl-CBS-oxazaborolidine". Use of the S-auxilliary will produce R-alcohols. In accordance with the forging references, the use of 5 mol% oxazaborolidine catalyst should give comparable results.

5 The dropping funnel was charged with a solution of borane-methylsulfide (0.70 g, 0.87 mL, 9.3 mmol) in anhydrous THF (15 mL, dried over 4A sieves). The borane solution was added dropwise over 20 min keeping the reaction temperature less than -20 °C. The mixture was stirred for 1 h at -15 to -
 10 20 °C whereupon TLC analysis indicated consumption of the ketone. The reaction was quenched by careful addition of methanol (15 mL) at -20 °C and allowed to warm to ambient temperature and stir for 16 h. The volatiles were removed in vacuo and the residue was purified by silica gel
 15 chromatography (Biotage Flash 65, elution solvent 6/1 hexanes:ethyl acetate) to yield (R)-7-ethyltetralin-1-ol (1.82 g, 79%). Analytical chiral HPLC indicated a 96.6/3.4 mixture of enantiomers (Chirocel OD-H column, isocratic elution 2:98 IPA/hexane, 0.9 mL/min, RT 15.2 min (minor enantiomer), 17.5
 20 min (major enantiomer)).

Example 3: Preparation of (S)-7-Ethyl-1,2,3,4-tetrahydro-1-naphthylamine hydrochloride

25 See generally: Rover, S.; Adam, G.; Cesura, A. M.; Galley, G.; Jenck, F.; Monsma Jr., F. J.; Wichmann, J.; Dautzenberg, F. M. *J. Med. Chem.* **2000**, 43, 1329-1338. The authors therein report a somewhat diminished yield due to partial formation of a dihydronaphthalene via elimination of
 30 the hydroxyl moiety.

More specifically, a solution of (R)-7-ethyltetralin-1-ol (1.77 g, 10.1 mmol) in toluene (25 mL) was cooled in an ice bath and treated with diphenylphosphorylazide (DPPA, 3.3 g, 2.7 mL, 12 mmol). A solution of 1,8-diazabicyclo[5.4.0]undec-
5 7-ene (DBU, 1.8 g, 1.8 mL, 12 mmol) in toluene (8 mL) was added over 20 min and the mixture was allowed to stir at 0 °C for 2 h and ambient temp for 16 h. The mixture was filtered through a pad of silica gel (eluted 6:1 hexanes/ethyl acetate) to remove precipitates and the volatiles were removed *in vacuo*
10 to give an oily residue of the crude S-azide. This material was used directly in the next step without further characterization.

The azide was dissolved in dry THF (20 mL) and added dropwise at RT to a slurry of lithium aluminum hydride (0.459
15 g, 12 mmol) in dry THF (20 mL). The mixture was stirred at RT for 1h and then heated to reflux for 1 h. The reaction was cooled to RT and quenched by successive addition of water (0.45 mL), 15% aq NaOH (0.45 mL) and water (1.4 mL). The resulting mixture was stirred for 1 h and then filtered
20 through a pad of Celite (eluted diethyl ether). The volatiles were removed *in vacuo* and the residue taken up into ethyl acetate (40 mL) and treated with 4N HCl in dioxane (3 mL). The resulting precipitate was filtered (wash ethyl acetate), collected and vacuum dried to give (S)-7-ethyl-1,2,3,4-
25 tetrahydro-1-naphthylamine hydrochloride as a white solid (1.09 g, 51%). Analytical chiral HPLC indicated a 96:4 mixture of enantiomers (Daicel Crownpak (-) column, isocratic elution 10% methanol in water (0.1% TFA), 0.8 mL/min, RT 56.2 min (minor enantiomer), 78.2 min (major enantiomer)).

30 Scheme VIII below depicts formation of a tetralinol, prepared in three steps starting from 7-bromo-1-tetralone. The first step involves an asymmetric reduction of the ketone using borane and Corey's oxazaboralidine chiral auxilliary. This reduction produced a 98:2 mixture of (presumably) R/S

enantiomers. A Mitsunobu-like S_N2 conversion to the azide and $LiAlH_4$ reduction to the amine produced material 96:4 S/R.

Example 4: Preparation of (R)-7-Bromotetralin-1-ol

5

The reduction is performed using the general procedure described in example 2. Analytical chiral HPLC of the product indicated a 98:2 mixture of enantiomers (Chirocel OD-H column, isocratic elution 2:98 IPA/hexane, 0.9 mL/min, RT 18.4 min (minor enantiomer), 19.5 min (major enantiomer). Proton NMR was consistent with that previously reported for the racemate: Saito, M.; Kayama, Y.; Watanabe, T.; Fukushima, H.; Hara, T. *J. Med. Chem.* **1980**, *23*, 1364-1372.

10

15 **Example 5:** Preparation of (S)-7-Bromo-1,2,3,4-tetrahydro-1-naphthylamine hydrochloride

The above compound is prepared essentially according to the procedure described in Example 3. The final compound is obtained as a white solid. Analytical chiral HPLC indicated a 96:4 mixture of enantiomers (Daicel Crownpak (-) column, isocratic elution 10% methanol in water (0.1% TFA), 0.8 mL/min, RT 39.4 min (minor enantiomer), 57.6 min (major enantiomer)).

Example 6: Preparation of Precursor Substituted Amines

Precursore amines can generally be prepared as shown above. Specific examples are described below.

Example 7: Preparation of 3-Ethylbenzaldehyde from 3-bromobenzaldehyde

3-Bromobenzaldehyde (Aldrich, 1.17 mL, 10.0 mmol) was dissolved in THF (20 mL) at rt. To it was added PdCl₂(dppf)•CH₂Cl₂ complex (Aldrich, 82 mg, 0.10 mmol), 2 M potassium phosphate (aq, 10 mL, 20 mmol), and triethylborane (Aldrich, 1.0 M solution in hexanes, 10 mL, 10 mmol). This was heated to reflux for 4 h, whereupon the mixture was allowed to cool to rt. The reaction mixture was partitioned between EtOAc and water. The organic layer was separated, dried (MgSO₄), and concentrated under reduced pressure. The residue was purified by flash chromatography (20% EtOAc/hexanes elution) to give a clear, colorless oil which was used without further purification: mass spec (CI) 135.1.

Example 8: Preparation of 3-Ethyl- α -propylbenzyl alcohol from 3-ethylbenzaldehyde

Upon completion of addition, the reaction mixture was allowed to warm to rt for 2 h. Reaction was then quenched by addition of water (1 mL), then concentrated under reduced pressure. The residue was purified by flash chromatography (R_f = 0.71 in 30%

EtOAc/hexanes) to give a colorless oil as product (804 mg, 94%): mass spec (CI) 161.1 (M-OH).

Example 9: Preparation of 3-Ethyl- α -propylbenzyl azide from 3-ethyl- α -propylbenzyl alcohol

3-Ethyl- α -propylbenzyl alcohol (803 mg, 4.51 mmol) was dissolved in THF (10 mL), and cooled to 0 °C. Triphenylphosphine (Aldrich, 1.416 g, 5.40 mmol), diethyl azodicarboxylate (Aldrich, 0.85 mL, 5.40 mmol), and diphenyl phosphoryl azide (1.16 mL, 5.38 mmol) was added in succession by syringe. This was stirred at 0 °C for 1 ¼ h, then at rt for 2 h, whereupon the reaction mixture was concentrated under reduced pressure. Step B-2 *tert*-butyl (4S)-6-iodo-3,4-dihydro-2H-chromen-4-ylcarbamate.

To a suspension of amine (S)-mandelic salt (4.55 g, 10.6 mmol) in water (50 mL) was added sodium hydroxide (21 mL, 2 N, 42 mmol) followed by di-*tert*-butyl dicarbonate (2.58 g, 11.7 mmole) and chloroform (50 mL). The organic layer was separated washed with saturated sodium chloride, dried (sodium sulfate), filtered, and concentrated under reduced pressure. The residue was triturated with 1:1 hexanes/ethyl ether. The resulting white solid was collected by filtration and washed with hexanes to provided *tert*-butyl (4S)-6-iodo-3,4-dihydro-2H-chromen-4-ylcarbamate (3.30 g, 83%): ^1H NMR (300 MHz, CDCl_3) δ 7.55 (d, J = 1.8 Hz, 1H), 7.42 (dd, J = 8.6, 2.2 Hz, 1H), 6.58 (d, J = 8.6 Hz, 1H), 4.78 (m, 2H), 4.28-4.20 (m, 1H), 4.18-4.10 (m, 1H), 2.19-2.10 (m, 1H), 2.06-1.96 (m, 1H), 1.49 (s, 9H).

The mixture was stirred at r.t. under nitrogen for 48 hours (progress monitored by LC/MS and HPLC). The mixture was quenched with aqueous NH_4Cl (20 mL) and extracted with EtOAc (3 x 50 mL). To 1.2 g (50 mmol) of magnesium turnings in 15 mL of dry THF is added a small crystal of iodine followed by 40 μL of dibromoethane. This mixture is placed in a water bath at 50 $^{\circ}\text{C}$ and 3-isopropylbromobenzene (5.0 g, 25 mmol) in 15 mL of dry tetrahydrofuran (THF) is added dropwise over 20 min, while the bath temperature is raised to 70 $^{\circ}\text{C}$. The mixture is stirred and refluxed for 40 additional min. The solution is cooled in an ice-water bath and cyclohexanone (2.0 mL, 19 mmol) in 10 mL of dry THF is added dropwise over 15 min. The ice bath is removed and the mixture is allowed to warm to ambient temperature over 1h. The solution is decanted into aqueous saturated NH_4Cl , and combined with an ether wash of the residual magnesium turnings. The organic phase is washed twice more with aqueous NH_4Cl , dried over anhydrous Na_2SO_4 , filtered and concentrated. Chromatography on silica gel, eluting with 10% ethyl acetate in heptane, affords 2.7 g (12 mmol, 60%) of compound 1 as an oil: ^1H NMR (CDCl_3) δ 7.39 (m, 1 H), 7.3 (m, 2 H), 7.12 (m, 1 H), 2.92 (m, 1 H), 1.84-1.54 (m, 10 H), 1.26 (d, $J = 7$ Hz, 6 H).

Step 2. Preparation of 1-(3-isopropylphenyl)cyclohexylazide (2).

To 3.20 g (14.7 mmol) of compound 1 in 60 mL of CH₂Cl₂ under nitrogen is added 2.10g (32.3 mmol) of sodium azide. The stirred suspension is cooled to -5°C and a solution of trifluoroacetic acid (9.0 mL, 120 mmol) in 35 mL of dichloromethane is added dropwise over 1 h. The organic phase is washed with an additional portion of water, followed successively by 1 N KH₂PO₄, water, and brine. It is then dried over anhydrous Na₂SO₄, filtered and concentrated to afford 3.6 g (14.7 mmol, 100%) of 2 as a pale yellow oil: ¹H NMR (CDCl₃) δ 7.3 (m, 2 H), 7.25 (m, 1 H), 7.16 (m, 1 H), 2.92 (m, 1 H), 2.01 (m, 2 H), 1.83 (m, 2 H), 1.73-1.64 (m, 5 H), 1.3 (m, 1 H), 1.26 (d, J = 7 Hz, 6 H).

To a stirred suspension of pulverized K_2CO_3 (49 g, 350 mmol) in 250 mL of acetone is added 6.5 mL (11.3 g, 59 mmol) of 2-fluoro-4-bromophenol and 7 mL (10 g, 59 mmol) of benzyl bromide. The mixture is refluxed under nitrogen 5 h. It is cooled and filtered, washing the residual K_2CO_3 with acetone. Removal of the solvent leaves 17 g of an off-white solid. This is triturated twice with hexanes, redissolved in 250 mL of CH_2Cl_2 , and washed successively with 10% Na_2CO_3 , water, and brine. The organic phase is dried over Na_2SO_4 and treated with decolorizing charcoal. Filtration and evaporation affords

1-benzyloxy-2-fluoro-4-bromobenzene **13** (13.7g, 49 mmol, 83%) as a colorless oil which crystallizes to a white solid: 1H NMR ($CDCl_3$) δ 7.43-7.33 (m, 5 H), 7.24 (dd, J = 2.3, 10 Hz, 1

H), 7.14 (dt, $J = 2, 8.7$ Hz, 1 H), 6.86 (t, $J = 8.7$ Hz, 1 H), 5.12 (s, 2 H).

Step 2. Preparation of tert-butyl (1S)-2-(4-(benzyloxy)-3-fluorophenyl)-1-[(4S)-2,2-dimethyl-1,3-dioxolan-4-yl]ethylcarbamate (**15**).

A solution of 1-benzyloxy-2-fluoro-4-bromobenzene **13** (7.0 g, 25 mmol) in 20 mL of dry THF is added dropwise over 20 min to 1.22 g (50 mmol) of magnesium turnings in 10 mL of refluxing THF under nitrogen and the mixture is refluxed for an additional 25 min to form the Grignard reagent. The Grignard solution is cooled and added by cannula to a suspension of CuBr-dimethylsulfide complex (0.52 g, 2.5 mmol) in 15 mL of dry THF at -25°C . The brown suspension is stirred at -25°C for 20 min, and then a solution of tert-butyl (2R)-2-[(4S)-2,2-dimethyl-1,3-dioxolan-4-yl]aziridine-1-carboxylate **14** (3.4 g, 14 mmol) in 15 mL of THF is added dropwise over 5 min. The mixture is allowed to gradually warm to ambient temperature over 3 h. Saturated aqueous NH_4Cl and ethyl ether are added, and the organic phase is washed with two more portions of saturated NH_4Cl and once with brine. The solution is dried over Na_2SO_4 and treated with decolorizing carbon. Filtration and concentration gives a yellow solid, which is triturated twice with ether/heptane to afford 5.4 g (12 mmol, 86%) of compound **15** as a cream-colored solid: MS (CI) m/z 468.3 (MNa+), 446.3 (MH+).

water, methanol, and CH_2Cl_2 , and air-dried. The mixture is warmed to 50 °C and stirred for 2 h. It is filtered, washing first with methanol and a 1:1 mixture of methanol and CH_2Cl_2 . The receiver is then changed and the product is eluted from the resin with 1:1 methanol: CH_2Cl_2 containing 10% of NH_4OH . The filtrate is concentrated to afford 2.7 g of a white solid. This solid is dissolved in 60 mL of dry THF under nitrogen, cooled to 0 °C, and 2.0 g (9.2 mmol) of di-tert-butylidicarbonate is added. The ice bath is removed and the mixture is stirred at ambient temperature for 18 h. It is concentrated and chromatographed over silica gel, eluting with 49:49:2 to 58:38:4 ethyl acetate:heptane:methanol, affording 3.0 g (7.4 mmol, 53%, two steps) of compound **16** as a white solid: ^1H NMR (CDCl_3) δ 7.45-7.30 (m, 5 H), 7.01-6.88 (m, 3 H), 5.12 (s, 2 H), 4.52 (d, J = 9 Hz, 1 H), 3.78 (m, 1 H), 3.62 (m, 2 H), 3.32 (m, 2 H), 3.02 (dd, J = 4, 14 Hz, 1 H), 2.82 (m, 2 H), 1.39 (s, 9 H); MS (CI) m/z 428.2 (MNa^+), 406.3 (MH^+).

Trimethyl orthoacetate (0.94 mL, 7.4 mmol) is added to a suspension of compound **16** (2.9 g, 7.2 mmol) in 30 mL of CH_2Cl_2 stirred under nitrogen. Pyridinium *p*-toluenesulfonate (18 mg, 0.07 mmol) is added and the resulting pale yellow solution is stirred for 30 min and then concentrated to a white solid. This solid is dissolved in 30 mL of CH_2Cl_2 , triethylamine (0.10 mL, 0.72 mmol) is added, and the mixture, under nitrogen, is cooled in an ice bath. Freshly distilled acetyl bromide (0.55 mL, 7.4 mmol) is added dropwise over 3-4 min with stirring. After 1 h, the ice bath is removed and aqueous 1 N NaHCO_3 and CH_2Cl_2 are added. The aqueous phase is extracted with additional CH_2Cl_2 and the combined organic phases are dried over MgSO_4 and concentrated to a white solid. This solid is

suspended in 25 mL of methanol and 6 mL of THF, and cooled in an ice bath, under nitrogen. Pulverized KOH (0.60 g, 11 mmol) in 6 mL of methanol is added all at once. Scheme 10

**Step 1.** Preparation of formyl imidazole 40.

5 To a solution of formic acid (0.76 mL, 20 mmol, 96%) in CH₂Cl₂ stirring under nitrogen is added, portionwise over 10 min, 3.6 g (22 mmol) of carbonyldiimidazole, and the mixture is allowed to stir overnight. Anhydrous MgSO₄ is added, and after several hours the mixture is filtered and concentrated

10 in vacuo (note: formyl imidazole is volatile and this operation should be carefully monitored for maximum recovery) to afford 0.7 g of iridescent crystals. The NMR spectrum showed the presence of formyl imidazole 40: ¹H NMR (CDCl₃) δ 9.15 (s, 1 H), 8.14 (s, 1 H), 7.53 (s, 1 H), 7.20 (s, 1 H).

15 The crystals also contain imidazole (δ 7.71 (s, 1H), 7.13 (s, 2H)) and the relative peak intensity and relative molecular weights are used to determine the weight % of formyl imidazole in the product.

20 **Step 2.** Preparation of (1S,2R)-1-(3,5-difluorobenzyl)-2-hydroxy-3-{[1-(3-isopropylphenyl)cyclohexyl]amino}propylformamide hydrochloride 41

To a solution of amine 6 (209 mg, 0.43 mmol) in 4 mL of CH_2Cl_2 under nitrogen is added 125 μL (0.9 mmol) of triethylamine. To this mixture is added 75 mg of the solid from Step 1, which is determined by NMR to contain 63% by weight of formyl imidazole (47 mg, 0.49 mmol) and the solution is stirred for 20 min. Methanol (5 mL is added, followed by 2 mL of 1 N NaOH. The mixture is concentrated *in vacuo* and diluted with 1 N KH_2PO_4 and ethyl acetate. The organic phase is washed with 1 N NaHCO_3 and brine, and dried over Na_2SO_4 . Concentration and chromatography over silica gel, eluting with 5% to 7.5 % of methanol (containing 1% of NH_4OH) in CH_2Cl_2 affords a colorless oil. Ether and ethereal HCl are added, and the gel-like precipitate is concentrated *in vacuo* from ethanol and then ethyl acetate to afford 176 mg (0.37 mmol, 85%) of hydrochloride **41** as a white solid: ^1H NMR ($\text{CDCl}_3 + \text{CD}_3\text{OD}$ drop) δ 7.86 (s, 1 H), 7.39-7.28 (m, 4 H), 6.67 (m, 2 H), 6.60 (m, 1 H), 3.96 (m, 1 H), 3.79 (m, 1 H), 3.08 (dd, 1 H), 2.93 (m, 1 H), 2.7-2.5 (m, 4 H), 2.37 (dd, 1 H), 2.05 (m, 2 H), 1.78 (m, 2 H), 1.6 (m, 1 H), 1.45-1.3 (m, 3 H), 1.25 (dd, $J = 1, 7$ Hz, 6 H); MS (CI) m/z 445.3 (MH^+).

**Step 1. Preparation of fluoroacetyl imidazole 42.**

5 To a slurry of 1.2 g (12 mmol) of sodium fluoroacetate in 25 mL of CH_2Cl_2 is added, with swirling of the flask, 1 mL (12 mmol) of concentrated HCl (note: this operation must be carried out in an efficient hood; fluoroacetic acid is highly toxic!). About 1 teaspoonful of anhydrous MgSO_4 is added to the

10 flask, and the contents are filtered, rinsing the filter paper with 15 mL of CH_2Cl_2 . The combined filtrate and wash are placed under nitrogen, and 1.3 g (8 mmol) of carbonyldiimidazole is added portionwise to the stirring mixture over 20 min. NMR analysis of an aliquot removed 40 min later indicates nearly

15 complete reaction. After 1 h a teaspoonful of MgSO_4 is added, and the mixture is allowed to stir overnight. It is filtered and concentrated to remove most of the CH_2Cl_2 , leaving 1.6 g of a pale yellow oil. The NMR spectrum indicates the presence of CH_2Cl_2 , fluoroacetic acid, imidazole, and fluoroacetyl

20 imidazole 42 : ^1H NMR (CDCl_3) δ 8.26 (s, 1 H), 7.53 (s, 1 H), 7.15 (s, 1 H), 5.40 (d, $J = 47$ Hz, 2 H). Integration reveals the oil to be 28% by weight fluoroacetyl imidazole 42 (0.45 g,

3.5 mmol, 44%). The oil is diluted with CH₂Cl₂ to make a solution that is 0.2 M in **42**.

Step 2. Preparation of N-((1S,2R)-1-(3,5-difluorobenzyl)-2-hydroxy-3-{[1-(3-isopropylphenyl)cyclohexyl]amino}propyl)-2-fluoroacetamide hydrochloride **43**

To amine **6** (0.64 mmol) is added 1 N NaOH and ethyl acetate. The organic phase is washed with more 1N NaOH, brine, and then dried over Na₂SO₄ and concentrated to 265 mg of a colorless oil. This free base is dissolved in 3 mL of CH₂Cl₂ under nitrogen and 3.2 mL (0.64 mmol) of a 0.2 M solution of fluoroacetyl imidazole **42** in CH₂Cl₂ is added. The mixture is stirred for 5 min, and then aqueous 1N KH₂PO₄ and ethyl acetate are added. The organic phase is washed with 1N KH₂PO₄, 1N NaHCO₃, and brine, dried over Na₂SO₄, and concentrated. Chromatography over silica gel, eluting with 5 % methanol (containing 2% of NH₄OH) in CH₂Cl₂ affords a colorless oil. Ether and ethereal HCl are added, and the solvents are removed in vacuo to yield 256 mg (0.50 mmol, 78%) of hydrochloride **43** as a white solid: ¹H NMR (CDCl₃) δ 9.85 (m, 1 H), 8.0 (m, 1 H), 7.51 (s, 1 H), 7.37 (m, 2 H), 7.27 (m, 1 H), 6.80 (d, J = 7 Hz, 1 H), 6.68 (m, 2 H), 6.63 (m, 1 H), 4.63 (d, J = 47 Hz, 2 H), 4.16 (m, 1 H), 4.10 (m, 1 H), 2.98-2.93 (m, 2 H), 2.77-2.64 (m, 4 H), 2.35-2.2 (m, 3 H), 1.80 (m, 2 H), 1.59 (m, 1 H), 1.44-1.25 (m, 3 H), 1.28 (d, J = 7 Hz, 6 H); MS (CI) m/z 477.4 (MH⁺).

EXAMPLE 81: Preparation of N-((1S,2R)-1-(3,5-difluorobenzyl)-2-hydroxy-3-{[1-(3-isopropylphenyl)cyclohexyl]amino}propyl)ethanethioamide hydrochloride **46**

Scheme 13

Step 1. Preparation of thioacetyl-N-phthalimide **45**

Thioacetamide (1.9 g, 25 mmol) is suspended in 40 mL of CH_2Cl_2 and cooled in an ice bath under nitrogen. Phthaloyldichloride (3.6 mL, 25 mmol) is added slowly over 10 min via syringe while the mixture is stirred. The mixture becomes a clear orange solution transiently, eventually depositing a precipitate. After stirring for 40 h, the mixture is concentrated *in vacuo* (in the hood!). The oily coral solid is triturated with hexanes. Within minutes the hexanes mother liquor drops a precipitate, which is filtered off to afford 0.2 g of a light coral solid: ^1H NMR (CDCl_3) δ 7.99 (m, 2 H), 7.86 (m, 2 H), 3.08 (s, 3 H). The residual solids remaining after trituration with hexanes are further trituated with ether and then with CH_2Cl_2 . The combined mother liquors are concentrated to about 3 g of a red oily solid, which is chromatographed over silica gel, eluting with 10% to 20% ethyl acetate in heptane. The red fractions contained a product (concentrated to a coral solid, 0.77 g) with the same TLC retention (R_f = 0.32, 20% ethyl acetate in heptane) as the coral solid which had precipitated from hexanes. The total recovery is 0.97 g, 4.7 mmol, 19%.

Step 2. Preparation of N-((1S,2R)-1-(3,5-difluorobenzyl)-2-hydroxy-3-{[1-(3-isopropylphenyl)cyclohexyl]amino}propyl)ethanethioamide hydrochloride **46**.

To 164 mg (0.39 mmol) of the free base of compound **6** in 3 mL of approximately 0°C CH_2Cl_2 under nitrogen, is added solid thioacetyl-N-phthalimide **45** (80 mg, 0.39 mmol). The mixture is stirred for 20 min, and then 3 mL of methanol and 3 mL of 1N NaOH are added. The mixture is taken up in ethyl acetate and washed twice with 1N NaOH, once with water, and once with brine. It is dried over Na_2SO_4 , concentrated, and chromatographed over silica gel, eluting with 4% methanol (containing 2% NH_4OH) in CH_2Cl_2 . Product-containing fractions are concentrated to a colorless oil, which is dissolved in

ether and treated with ethereal HCl. Concentration affords 97 mg (0.19 mmol, 49%) of hydrochloride **46** as a white solid: ^1H NMR ($\text{CDCl}_3 + \text{CD}_3\text{OD}$ drop) δ 7.42-7.37 (m, 2 H), 7.29 (m, 2 H), 6.73 (m, 2 H), 6.62 (m, 2 H), 4.67 (m, 1 H), 4.10 (m, 1 H), 3.11 (dd, $J = 5, 14$ Hz, 1 H), 2.96 (hept, $J = 7$ Hz, 1 H), 2.83 (m, 1 H), 2.65-2.4 (m, 4 H, obscured by solvent), 2.38 (s, 3 H), 2.07 (m, 2 H), 1.78 (m, 2 H), 1.59 (m, 1 H), 1.44-1.35 (m, 3 H), 1.28 (d, $J = 7$ Hz, 6 H); MS (CI) m/z 475.3 (MH^+).

EXAMPLE 100:**A. Preparation of 1-tert-Butyl-3-iodo-benzene from 3-(tert-Butyl)aniline**

5

3-(tert-Butyl)aniline (Oakwood, 6.0 g, 40.21mmol) was slowly added to a cold solution of 12 N HCl (24.5 mL) while stirring over an ice/acetone bath in a three-neck round bottom flask equipped with a thermometer. A 2.9M solution of sodium nitrite (16 mL) was added via addition funnel to the reaction flask at a rate so as maintain the temperature below 2°C. The solution was stirred for 30 min. prior to being added to a reaction flask containing a 4.2M solution of potassium iodide (100 mL). The reaction mixture was allowed to stir overnight while warming to RT. The mixture was then extracted with a hexane/ether solution (1:1) followed by washing with H₂O (2X), 0.2N citric acid (2X) and sat. NaCl. The organic phase was separated, dried (Na₂SO₄) and concentrated under reduced pressure. The residue was purified by flash chromatography (100% Hexane) to give the desired iodo intermediate (8.33g, 80%): ¹H NMR (CDCl₃, 300 MHz) δ 1.34 (s, 9H), 7.07 (t, J = 8.0 Hz, 1H), 7.39(d, J = 8.0 Hz, 1H), 7.55(d, J = 8.0 Hz, 1H), 7.77 (t, J = 2.0 Hz, 1H).

B. Preparation of 1-(3-tert-Butyl-phenyl)-cyclohexanol from 1-tert-Butyl-3-iodo-benzene

1-tert-Butyl-3-iodo-benzene (8.19g, 31.49mmol) in anh. THF (35mL) was cooled to -78°C. A solution of 1.7M tert-butyl lithium was added and the reaction mixture was allowed to stir while under N₂ (g) inlet for 2 h. A solution of cyclohexanone

Palladium(II) acetate (0.2 equiv, 0.07 mmol, 15.8 mg) and 2-(di-*t*-butylphosphino)biphenyl (0.1 equiv, 0.035 mmol, 10.5 mg) were dissolved in THF (2 mL) and deoxygenated with a subsurface N₂ (g) purge for 5 minutes. N-BOC-1-(3-bromophenyl)aminocyclopropane (15.60g, 50.2 mmol) was treated with 4N HCl in dioxane (50 mL) and stirred for 2 h. The volatiles were evaporated in vacuo and the

residue taken up into 1N NaOH (250 mL). The mixture was extracted with diethyl ether (2 X 200 mL). The combined ether extracts were washed with brine (50 mL), dried (sodium sulfate), then filtered and evaporated *in vacuo* to provide the
5 amine free base.

The amine free base was dissolved in 2-propanol (250 mL) and the epoxide (15.0g, 50.2 mmol) was added. The mixture was heated to reflux for 22 h and allowed to stand at ambient temperature for 3 d. Analysis by HPLC indicated that the

The volatiles were removed *in vacuo* and the residue was purified by silica gel flash chromatography (eluted 2:1 hexane/ethyl acetate) to provide the final product (13.68 g,

The mixture was stirred over the weekend at room temperature. The solvent was then removed under reduced pressure and the residue was partitioned between 1N HCl and ethyl acetate, dried with magnesium sulfate, filtered, and concentrated to give 0.243 g of the title compound. (99% yield). MS (ESI+) for $C_{34}H_{41}F_2N_3O_4$ m/z 594.31 (M+H)⁺.

B.10. N-{(1S,2R)-1-(3,5-difluorobenzyl)-2-hydroxy-3-[(6-neopentyl-1,2,3,4-tetrahydroquinolin-4-yl)amino]propyl}acetamide

To a solution of benzyl 4-{[(2R,3S)-3-(acetylamino)-4-(3,5-difluorophenyl)-2-hydroxybutyl]amino}-6-neopentyl-3,4-dihydroquinoline-1(2H)-carboxylate (0.242 g) in EtOH (30 mL) was added 1N HCl (1.0 mL) and 10% palladium on carbon (0.030 g). The mixture was degassed with N_2 for five minutes. The mixture was placed on a hydrogenation apparatus under 47 psi of H_2 and was shaken for 4.5 hours. The palladium was filtered off using Celite and the solvent was concentrated under reduced pressure. The residue was then partitioned between water and ethyl acetate and the organic layers were washed with aqueous sodium bicarbonate, dried with magnesium sulfate, filtered, and concentrated. A silica gel column using 4% MeOH in dichloromethane with 0.25% NH_4OH as the solvent solution gave 0.095 g of the title compound. MS (ESI+) for $C_{26}H_{35}F_2N_3O_2$ m/z 460.27 (M+H)⁺.

Example 111

Reactions were monitored, and purity evaluated by TLC on silica gel GF, 250 μ slides obtained from Analtech, Inc., Newark, DE. Preparative low pressure (flash) chromatography was carried out on silica gel 60 (230-400 mesh ASTM) from EM Science, Gibbstown, NJ. Proton NMR spectra were collected on a Bruker Avance 400 spectrometer. Chemical shifts (δ) are in ppm, coupling constants (J) are in Hz. IR absorbances greater than 1200 cm^{-1} are reported. All reagents were obtained from commercial sources and were used without further purification. Unless otherwise noted, all solvents used in reaction were run under an inert atmosphere of nitrogen in over-dried glassware. Preparative flash chromatography was performed on silica gel 60 (230-240 mesh) from EM Science. HPLC analysis were carried out on a HP1100 system (Agilent) with the following a 1.0 mL/min linear gradient of 0.05% aqueous TFA (A) and 0.05% TFA in acetonitrile (B): 0% B: 5 min: 60% B, 15 min: 90% B, 2 min: 0% B. All solvents for chromatography were HPLC grade. Where not commercially available, starting materials and intermediates, including new and known compounds, were prepared by synthetic methods known in the art. HATU, which stands for *N*-[(dimethylamino)-1-*H*-1,2,3-triazolo[4,5-*b*]pyrindin-1-ylmethylene]-*N*-methylethanaminium hexafluorophosphate *N*-oxide, was bought from PE Biosystems. All hydrochloride salts were formed by addition of ethereal hydrochloric acid to an ethereal solution of amine, followed by concentration to dryness.

E. Synthesis of Chroman 32

The synthesis of aminochroman (**29**) is illustrated in scheme II. In scheme II, phenol **H140** underwent Michael addition with acrylonitrile to give nitrile **H141**. Subsequent acid hydrolysis gave carboxylic acid **H142**, which was then converted to the acid chloride and cyclized intramolecularly to give chromonone **H143**. Alpha bromination of ketone **H143** gave bromide **H144**, which was reduced with sodium borohydride to give bromo alcohol **H145**. Using Ritters reaction conditions, **H145** was transformed to racemic amino alcohol **29**. More specific experimental procedures follow the scheme.

Scheme II

Step 1: A mixture of 4-ethylphenol (H140, 26.69 g, 0.218 mol), acrylonitrile (50 mL, 0.754 mol, 3.5 equiv), and triton

 5 B (40 wt% in methanol, 5 mL, 0.011 mol, 0.05 equiv) was stirred at 84 °C in a sealed tube overnight. The reaction mixture was diluted with ether (300 mL) and the brown precipitate was removed by suction filtration. The ether solution was washed with 2 M sodium hydroxide aqueous solution

EXAMPLE 114**A. Synthesis of Neo-Pentylmagnesium Bromide**

A 3-necked, round-bottom flask fitted with an addition funnel, water condenser and magnetic stir bar was charged with magnesium turnings (10.0 g, 413.8 mmol), iodine (100 mg), and glass shards and then heated vigorously under vacuum with stirring for 20 min. The reaction flask was cooled to room temperature and then charged with argon and the magnesium turnings stirred for an additional 0.5 h. The flask was then charged with diethyl ether (65 mL) and the addition funnel charged with a solution of neo-pentyl bromide (20.0 g, 132.4 mmol) in diethyl ether (100 mL). Neat neo-pentyl bromide (2.5 g, 16.55 mmol) was added directly to the reaction mixture and the solution was gently warmed with a heat gun to initiate the reaction. Once the reaction was initiated, the contents of the addition funnel were added dropwise over the course of 1 h to maintain a gentle reflux. Another aliquot of neat neo-pentyl bromide (2.5 g, 16.55 mmol) was then added to the reaction mixture in one portion followed by dropwise addition of 1,2-dibromoethane (14.3 mL, 165.5 mmol) over the course of 1 h. Ethane gas generated was swept from the reaction flask by a steady stream of nitrogen. The reaction mixture was then heated at reflux for 24 h and cooled to room temperature to yield a black solution. The suspended solid was allowed to settle and the solution above the solid residue was neo-pentylmagnesium bromide (ca. 1.0 M in ether, 165.5 mmol), which was used in subsequent coupling reactions.

B. Synthesis of Amine 2b

Step 1: Di-tert-butyl dicarbonate (5.45 g, 25.0 mmol) was added in one portion at room temperature to a solution of compound (1) (5.05 g, 19.23 mmol) and *N,N*-diisopropylethylamine (10.0 mL, 57.7 mmol) in acetonitrile (32 mL) and the reaction mixture was stirred at room temperature for 36 h. The solvent was removed under reduced pressure and the residue partitioned between ethyl acetate and saturated sodium bicarbonate. The phases were separated and the organic

phase was washed with water, saturated sodium chloride, dried (sodium sulfate), filtered, and concentrated under reduced pressure to yield the desired protected amine (7.38 g, quantitative) as a waxy solid, which was used in the next step without further purification: ^1H NMR (300 MHz, CDCl_3) δ 7.47 (s, 1H), 7.28–7.24 (m, 1H), 6.94 (d, $J = 8.2$ Hz, 1H), 4.77 (m, 2H), 2.72–2.66 (m, 2H), 2.04–2.00 (m, 1H), 1.83–1.72 (m, 3H), 1.44 (s, 9H).

Following Grignard addition, the reaction mixture was stirred for 0.5 h to yield a white heterogenous suspension. [1,1'-Bis(diphenylphosphino)ferrocene]dichloropalladium(II) complex with dichloromethane (1:1) (1.60 g, 1.92 mmol) was added in one portion followed by dropwise addition over 20 min of a solution of the protected amine prepared in step 1 (7.38 g, 19.23 mmol) in tetrahydrofuran (20 mL) to yield a yellow reaction mixture. The reaction mixture was stirred at room temperature for 0.5 h then heated at reflux for 2 h to yield a brown solution. The reaction mixture was cooled to room temperature and carefully quenched with 10% hydrochloric acid (100 mL) and the reaction mixture was stirred at room temperature overnight. The reaction mixture was diluted with diethyl ether and the phases separated. The organic phase was then washed with water, saturated sodium chloride, dried (sodium sulfate), filtered, and concentrated under reduced pressure to yield a brown semisolid. Purification by flash column chromatography (silica, 19:1 hexanes/ethyl acetate) afforded protected amine **2a** (3.0 g, 49%) as a yellow oil: ^1H NMR (300 MHz, CDCl_3) δ 7.08 (s, 1H), 6.98–6.90 (m, 2H), 4.82–4.75 (m, 2H), 2.76–2.69 (m, 2H), 2.43 (s, 2H), 2.04–1.97 (m, 1H), 1.84–1.80 (m, 3H), 1.47 (s, 9H), 0.88 (m, 9H); ESI MS m/z 318 $[\text{C}_{20}\text{H}_{31}\text{NO}_2 + \text{H}]^+$.

15 quenched by the addition of saturated ammonium chloride and diluted with diethyl ether. The organic layer was dried (sodium sulfate), filtered, and concentrated under reduced pressure. Purification by flash column chromatography (silica, 6:1 hexanes/ethyl acetate) gave an alcohol (3.72 g,
20 90%) as a clear oil: 1H NMR (300 MHz, $CDCl_3$) δ 7.67 (s, 1H), 7.38 (d, J = 8.7 Hz, 2H), 7.21 (m, 1H), 1.57 (s, 6H).

Step 2: A mixture of the alcohol from step 1 (1.68 g, 7.82 mmol), 2-methylpropylboronic acid (1.19 g, 11.73 mmol), and sodium carbonate (13.69 mL, 2 M aq, 27.38 mmol) was
25 degassed with nitrogen for 20 min. Tetrakis(triphenylphosphine)palladium(0) (450 mg, 0.391 mmol) was added and the reaction mixture was heated at reflux overnight. The reaction mixture was cooled to room temperature, filtered through diatomaceous earth, and
30 concentrated under reduced pressure. Purification by flash column chromatography (silica, 4:1 hexanes/ethyl acetate) gave alcohol 156 (1.11 g, 74%) as a clear oil: 1H NMR (300 MHz, $CDCl_3$) δ 7.28–7.24 (m, 3H), 7.11 (d, J = 7.2 Hz, 1H), 2.48 (d, J = 6.1 Hz, 2H), 1.84 (m, 1H), 1.58 (s, 6H), 0.92 (d, J = 7.1

A. Preparation of [(1*S*, 2*R*)-3-((1*S*)-5-Bromo-7-ethyl-1,2,3,4-tetrahydro-naphthalen-1-ylamino)-1-(3,5-difluoro-benzyl)-2-hydroxypropyl]-carbamic acid tert-butyl ester **3**

A solution of *N*-BOC-epoxide **1** (869mg, 2.91mmol) and the bromo-substituted 1-amino-tetrahydronaphthalene **2** (783 mg, 2.91 mmol) in 10 mL isopropanol, is heated to 80°C for 6 hours. After completion of the reaction, the mixture is cooled and product **3** crystallizes from the crude solution, and collected by filtration. The crystals are washed with cold ethanol. After vacuum is applied to remove traces of volatiles, the reaction yields about 995 mg of **3** ($[M+H]^+ = 552.8$).

B. Preparation of (3*S*, 2*R*)-3-Amino-1-((1*S*)-5-bromo-7-ethyl-1,2,3,4-tetrahydro-naphthalen-1-ylamino)-4-(3,5-difluoro-phenyl)-butan-2-ol **4**

Compound **3** (995 mg) is dissolved in 10 mL of anhydrous CH₂Cl₂ followed by the addition of 10 mL of trifluoroacetic acid (anhydrous). The solution stands for 90 min. then the volatiles are removed with a stream of nitrogen. The compound is desalted by extraction between ethyl acetate, 10mL, and saturated aqueous sodium bicarbonate, 20 mL. The ethyl acetate phase is washed a second time with saturated sodium bicarbonate. The organic phase is then dried with MgSO₄

30

C. Preparation of N-[(1*S*, 2*R*)-3-((1*S*)-5-Bromo-7-ethyl-1,2,3,4-tetrahydro-naphthalen-1-ylamino)-1-(3,5-difluorobenzyl)-2-hydroxypropyl]-acetamide **5**

To a solution of diamine **4** (350 mg, 0.77 mmol) in 5 mL anhydrous CH_2Cl_2 , is added HOBT (125mg, 0.93mmol), *N*-methylmorpholine (0.17mL, 1.55mmol), and glacial acetic acid (46.4mg, 0.773).

This solution is cooled to 0°C via ice bath and then solid EDC-HCl (1-[3-(Dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride, 163 mg, 0.85 mmol) and a stir bar was added. The reaction is stirred at 0°C for 12 hours. After the warming to room temperature, the solvent is removed with a stream of N_2 , and the residue washed between ethyl acetate and aqueous saturated sodium bicarbonate. The ethyl acetate phase is dried with $MgSO_4$ (anhydrous), filtered then removed of solvent by rotory evaporation and high vacuum to yield 295mg of compound **5** ($[M+H]^+ = 494.8$).

D. Preparation of [(3*S*, 2*R*)-3-Acetylamino-4-(3,5-difluorophenyl)-2-hydroxybutyl]-((1*S*)-5-bromo-7-ethyl-1,2,3,4-tetrahydronaphthalen-1-yl)-carbamic acid tert-butyl ester **6**

To a solution of amine **5** (295 mg, 0.6 mmol) in 5 mL anhydrous THF is added *N,N'*-diisopropylethylamine (0.35 mL, 1.2 mmol) and di-*t*-butyl dicarbonate (145 mg, 0.66 mmol). The solution is stirred overnight followed by solvent removal with stream of nitrogen. The product is isolated by first washing the residue between ethyl acetate (10 mL) and 1N sodium bisulfate (20 mL). The ethyl acetate layer was then washed against aqueous saturated sodium bicarbonate (20 mL). The ethyl acetate layer was dried with $MgSO_4$ (anhydrous), filtered then removed of solvent by rotory evaporation and high vacuum to yield 354.4 mg of **6** ($[M+H]^+ = 594.5$).

20 5-butyl-7-ethyl-1,2,3,4-tetrahydro-naphthalen-1-yl)-carbamic acid tert-butyl ester **8a**

The following process is performed in a nitrogen-filled glove box. To a solution of **7** (73 mg, 0.1 mmol) in 0.1 mL of anhydrous THF is added a solution of Pd(OAc)₂ (2.25 mg, 0.01
25 mmol) and 2-(di-*t*-butylphosphino)biphenyl (5.9 mg, 0.01 mmol) in 0.1 mL of anhydrous THF. The reaction is started by addition of butylzinc bromide (0.5*M* in THF, 0.5 mL, 0.25 mmol). The reaction is stirred for 16 hrs, after which the solvent is removed with a stream of nitrogen, and the residue
30 is redissolved in methanol (1mL) for purification by reversed phase HPLC. The butylated product **8a** (*[M+H]*⁺ = 709.1) is obtained as an oil after evaporation of solvent (rotory evaporation and high vacuum).

Commercially available 3,4-dibromobenzaldehyde (250mg, 0.95 mmol) and N-BOC-diamine 10 (250 mg, 0.79 mmol), are dissolved together in 10 mL of 10% acetic acid in THF. After the solution was allowed to stand at room temperature for 30 min., 1.7g (~3.8mmol) of MP-cyanoborohydride (a macroporous

Example 133

3-Bromobenzyl nitrile was obtained from Kimera. Powder KOH was obtained from Oxechem. Other reagents were from Aldrich.

Step 1: 1-(3-bromophenyl)cyclohexanecarbonitrile

To a 5 L 3-neck round bottom flask equipped with N₂ inlet, temperature probe, addition funnel, and mechanical stirrer was added 3-bromobenzyl nitrile (297 g, 1.51 mol, 1.0 eq) and THF (2.75 L). The clear solution was cooled to 0-5° C via ice bath. KOtBu (374 g, 3.33 mol, 2.2 eq) was weighed out inside the glove box into a 200 mL round bottom flask and added to the cold clear solution in shots. The first shot (71.1 g) was added over 30 seconds and an immediate exotherm of 9° C was observed along with color change from clear to orange/brown solution. After waiting for 15 min for the solution to cool back down to 5.1° C, the second shot (96.0 g) was added and an exotherm of 6.5° C was observed. After another 15 min, the third shot (100.4 g) was added and an exotherm of 5° C was observed. After another 15 min, the fourth and final shot (106.5 g) was added and an exotherm of 3.8° C was observed. The orange/brown solution was stirred in ice bath for 30 min upon which the solution thickened. Carefully add 1,5-dibromopentane (365.5 g, 1.56 mol, 1.05 eq) to orange/brown mixture at such a rate to maintaining reaction temperature <15° C. The reaction will change from solution to brown slurry and the exotherm will continue to climb during addition. The addition took ca 2 hours. The addition funnel was rinsed with THF (250 mL) and added to the brown slurry. The ice bath was then removed and the slurry self-warmed to RT while maintaining medium agitation. Sample of the slurry was pulled after 1 hour of stirring. GC indicated completion with only excess 1,5-dibromopentane and product. The light brown slurry was then filtered over a pad of celite to remove salts. The cake was rinsed with THF (ca 2 L) until clear. Ice (ca 1 L in volume) was then added to the burgundy filtrate and stirred at RT overnight. The mixture was then concentrated to remove THF and the resultant biphasic brown mixture was extracted with EtOAc and saturated NaCl solution. The orange organic layers were dried with anhydrous Na₂SO₄, filtered and rinsed with EtOAc. The orange filtrate was then concentrated

to dryness to give red oil. EtOAc (100 mL) was added to redissolve oil. While stirring at medium speed, heptane (2 L) was added over 1-2 min upon which burgundy oil sticks to bottom and sides of flask. The yellow solution was then
5 carefully decanted away from the sticky oil and concentrated to dryness to give light orange oil (379.7 g, 95% yield). GC of light orange oil indicated excess 1,5-dibromopentane (2.8 area%), product (95.3 area%), and 7 other peaks having less than 0.5 area% (total = 1.9 area%).

Step 2: 1-(3-bromophenyl)cyclohexanecarboxamide

With overhead stirrer, a mixture of crude product from step 1, above, (380 g, 1207 mmol), powdered KOH (720 g) and t-BuOH (2.5 L) was heated at reflux overnight. See Hall, J. H.; Gisler, M. Step 3: 1-(3-bromophenyl)cyclohexanamine hydrochloride,

5

The product from step 2, above (189 g, 603 mmol) was suspended in warmed t-BuOH (1140 mL) at ~35°C, 3N NaOH (570 mL, 2.8 equiv) was added. The reaction cooled to 30°C. NaOCl (380 mL, 13.6wt%, 1.4 equiv.) was added in one portion. The reaction mixture was cooled to 26°C, and then started to warm up. Ice was directly added to the mixture to controlled the temperature <35°C. A total of 300 g of ice was used. The heat generation stopped after 15 min. All solids dissolved at that point. Assayed organic layer at 30 min, GC indicated completion. The mixture was extracted with 1100 mL of MTBE. The organic layer was combined with the organic layer of a parallel run of the same scale, and filtered to remove some white ppt (likely urea side product). The aqueous layers were extracted with 300 mL of MTBE. The combined MTBE layers (ca. 5 L) was treated with 150 mL of conc. HCl (1.8 mol), stirred for 4h, cooled to 0°C and filtered. The white solid was dried at 50°C to give 1st crop 180 g (52%) of material. The filtrate was treated with NaOH and NaHSO₃ to pH>12. The organic layer was concentrated to an oil. This oil was dissolved in 1 L of MTBE and treated with 75 mL of conc. HCl, cooled, filtered and dried to give 140 g (40%) of the desired product .Anal. Step 4: tert-butyl-(1S,2R)-3-{[1-(3-bromophenyl)cyclohexyl]amino}-1-(3,5-difluorobenzyl)-2-hydroxypropylcarbamate,

5 The product from step 3, above (90 g, 310 mmol, 1.5 eq) was converted into a free base in 1000 mL of MTBE/400 mL of 2N NaOH. MTBE layer was separated, washed with brine. Aqueous layers were back extracted with 400 mL of MTBE. Combined MTBE layer was concentrated (theoretical 78.3 g) to afford the free
10 base.

61.7 g the epoxide (206 mmol, 1 eq., FW 299.3) and the above free base were suspended in 320 mL t-BuOH (warm). A mantle and thermo/probe was used to heat the stirring mixture to 80°C at 5°C/hour ramp overnight. The mixture was
15 concentrated on rotovap with 20°C condenser. The resulting oil was dissolved in MTBE (1L), washed with 1N HCl (200mL, then 100 mL x 5) (contain the product from step 3, the first wash was quickly separated to avoid crash out). Aqueous layer was sequentially back-extracted with MTBE (200 mL). The MTBE
20 layer was stirred with 1N NaOH (500 mL) for 30 min, then separated. MTBE layer was washed with brine and then concentrated to dryness. Recrystallized in MTBE/Heptane (150/900 mL). Filtered at 0°C and washed with heptane (150 mL x 2), dried at 45°C, 95.3 g (83.5%).

25 The HCl washes (suspension) were basified with 50% NaOH (ca. 50 g), extracted with MTBE (400 mL + 200 mL). The MTBE layer was treated with conc. HCl (15 mL). The resulting suspension was cooled and filtered to give the unreacted starting amine, the product from step 3, above, 31.3 g (52%).

Example 134

tert-butyl (1S)-2-(3,5-difluorophenyl)-1-[(2S)-oxiran-2-yl]ethylcarbamate

Step 1: (2S)-2-[(tert-butoxycarbonyl)amino]-3-(3,5-difluorophenyl)propanoic acid methyl ester

To a 1-L 3-neck round bottom flask equipped with a magnetic stirrer, nitrogen inlet and thermocouple is added (2S)-2-[(tert-butoxycarbonyl)amino]-3-(3,5-difluorophenyl)propanoic acid (I, 40 g, 0.133 moles, 1 equivalent) followed by THF (240 mL). Lithium hydroxide monohydrate (5.6 g, 0.133 moles, 1 equivalent) is added in a single portion and is allowed to stir for 30 min at which time, the contents are cooled to 0°. Once cooled, dimethyl sulfate (12.6 mL, 0.133 moles, 1 equivalent) is added dropwise via syringe and then stirred for 30 min. The mixture is then heated to about 50° and monitored (by HPLC) until 90% conversion had been achieved. At that time, the mixture is cooled to below 20° (solids form). The mixture is then poured into sodium bicarbonate (200 mL), stirred for 15 min then extracted with methyl *t*-butyl ether (200 mL). The phases are separated and the aqueous layer is extracted with methyl *t*-butyl ether (2 x 200 mL). The combined organic phases are washed with water (400 mL) dried over sodium sulfate, filtered and concentrated under reduced pressure to give a solid. This material is then recrystallized from hexanes to give the title compound, NMR (DMSO-*d*₆) δ 7.51, 7.15-7.25, 4.43, 3.81, 3.00-3.26 and 1.49; CMR (DMSO-*d*₆) δ 172.43, 163.74, 161.20, 155.67, 142.58, 112.70, 120.23, 78.69, 54.71, 52.24, 39.25 and 28.37.

Step 2: *tert*-butyl (1*S*)-3-chloro-1-(3,5-difluorobenzyl)-2-oxopropylcarbamate (III)

5 To a 1-L 3-neck round bottom flask equipped with a magnetic stirrer, nitrogen inlet, thermocouple and additional funnel is added (2*S*)-2-[(*tert*-butoxycarbonyl)amino]-3-(3,5-difluorophenyl)propanoic acid methyl ester (II, Step 1, 10.0 g, 0.0317 moles, 1 equivalent) followed by THF (175 mL) then
 10 cooled to -78°. Once the mixture is cooled, iodochloromethane (9.25 mL, 0.127 moles, 4 equivalents) is added in one portion via syringe. The addition funnel is charged with LDA (79 mL, 0.158 moles, 5 equivalents, 2.0 M in heptane/THF) and is subsequently added dropwise to the mixture keeping the
 15 internal temperature below -70°. Once the addition is complete, the contents are stirred for 15 min at which time acetic acid (47.2 mL, 0.824 moles, 26 equivalents) is added dropwise via the addition funnel keeping the internal temperature below -65°. Once this addition is complete, the
 20 mixture is stirred for 15 min then warmed to 0° and poured into water (500 mL), saline (500 mL) and methyl *t*-butyl ether (500 mL) then transferred to a separatory funnel. The phases are separated and the aqueous phase is extracted with methyl *t*-butyl ether (2 x 250 mL). The combined organic phases are
 25 washed with saturated sodium bicarbonate (500 mL), sodium sulfite (500 mL) and water (500 mL). The organic phase is then dried over sodium sulfate, filtered and concentrated under reduced pressure to give a solid. The solid is recrystallized from heptane/*i*-propyl alcohol (10/1) to give the
 30 title compound, NMR (DMSO-*d*₆) δ 7.47, 7.06-7.14, 4.78, 4.49,

3.20, 2.82 and 1.40; CMR (DMSO- d_6) δ 200.87, 163.74, 161.20, 142.74, 112.80, 102.13, 79.04, 58.97, 47.72, 34.95 and 28.30.

Step 3: tert-butyl (1S,2S)-3-chloro-1-(3,5-difluorobenzyl)-
2-hydroxypropylcarbamate (IV)

To a 250 mL 3-neck round bottom flask equipped with magnetic stir bar, nitrogen inlet and thermocouple, is added tert-butyl (1S)-3-chloro-1-(3,5-difluorobenzyl)-2-oxopropylcarbamate (III, Step 2, 4.4 g, 0.0132 moles, 1 equivalent) followed by THF (20 mL) and ethanol (30 mL) then cooled to -78°. Once the mixture is cooled, sodium borohydride (2.0 g, 0.0527 moles, 4 equivalents) is added as a solid portion wise over 30 min keeping the internal temperature below -70°. Once this addition is complete, the contents are stirred for 2 hr at -78° then warmed to 0° and stirred an additional 1 hr. The mixture is quenched by the addition of saturated potassium bisulfate (15 mL) and water (15 mL). This slurry is stirred for 30 min at 20-25° then concentrated under reduced pressure to half its volume. The mixture is then cooled to 0° and stirred for 30 min. After this time, the resultant solids are collected by filtration and washed with water (2 x 50 mL) then dried under reduced pressure at 50° to give crude product. A syn/anti ratio of 4-9:1 has been observed. The desired product is recrystallized from hexanes/ethanol (25/1) to give the title compound, NMR (DMSO- d_6) δ 6.89-7.16, 5.61, 3.64-3.83, 3.19, 2.69 and 1.41; CMR (DMSO- d_6) δ 163.67, 161.24, 155.44, 112.70, 101.55, 78.04, 72.99, 54.29, 48.24, 35.97 and 28.37.

Step 4: tert-Butyl (1S)-2-(3,5-difluorophenyl)-1-[(2S)-oxiran-2-yl]ethylcarbamate

To a 250 mL 3-neck round bottom flask equipped with magnetic stir bar, nitrogen inlet and thermocouple, is added tert-butyl (1S,2S)-3-chloro-1-(3,5-difluorobenzyl)-2-hydroxypropylcarbamate (IV, Step 3, 3.5 g, 0.010 moles, 1 equivalent) followed by absolute ethanol (60 mL) and cooled to 0°. To this mixture is added potassium hydroxide (0.73 g, 0.013 moles, 1.25 equivalents) dissolved in absolute ethanol (10 mL) over 1 hr and the resulting suspension is warmed to 15-20° and stirred for 1 hr. At this time, water (100 mL) is added and the reaction contents are cooled to -5° and stirred for 30 min. The solids are collected by filtration and washed with cold water (2 x 25 mL) then dried under reduced pressure at 45° to give the title compound; NMR (DMSO-*d*₆) δ 7.03, 3.61, 2.68-2.98 and 1.33; CMR (DMSO-*d*₆) δ 163.72, 161.29, 155.55, 143.35, 112.65, 101.80, 78.17, 53.42, 52.71, 44.90, 36.98 and 28.36.

Generally, the protection of amines is conducted, where appropriate, by methods known to those skilled in the art.

5 Amino protecting groups are known to those skilled in the art. See for example, "Protecting Groups in Organic Synthesis", John Wiley and sons, New York, N.Y., 1981, Chapter 7; "Protecting Groups in Organic Chemistry", Plenum Press, New York, N.Y., 1973, Chapter 2. When the amino protecting group

10 is no longer needed, it is removed by methods known to those skilled in the art. By definition the amino protecting group must be readily removable. A variety of suitable methodologies are known to those skilled in the art; see also T.W. Green and P.G.M. Wuts in "Protective Groups in Organic

 25 more preferred that the protecting group be t-butoxycarbonyl.
 One skilled in the art will recognize suitable methods of
 introducing a t-butoxycarbonyl or benzyloxycarbonyl protecting
 group and may additionally consult T.W. Green and P.G.M. Wuts
 in "Protective Groups in Organic Chemistry, John Wiley and

The compounds of the invention may contain geometric or
 optical isomers as tautomers. Thus, the invention includes
 all tautomers and pure geometric isomers, such as the *E* and *Z*
 geometric isomers, as mixtures thereof. Further, the
 35 invention includes pure enantiomers, diastereomers and/or

mixtures thereof, including racemic mixtures. The individual geometric isomers, enantiomers or diastereomers may be prepared or isolated by methods known to those in the art, including but not limited to chiral chromatography; preparing
5 diastereomers, separating the diastereomers and then converting the diastereomers into enantiomers.

Compounds of the invention with designated stereochemistry can be included in mixtures, including racemic mixtures, with other enantiomers, diastereomers, geometric
10 isomers or tautomers. In a preferred aspect, compounds of the invention are typically present in these mixtures in diastereomeric and/or enantiomeric excess of at least 50 percent. Preferably, compounds of the invention are present in these mixtures in diastereomeric and/or enantiomeric excess
15 of at least 80 percent. More preferably, compounds of the invention with the desired stereochemistry are present in diastereomeric and/or enantiomeric excess of at least 90 percent. Even more preferably, compounds of the invention with the desired stereochemistry are present in diastereomeric
20 and/or enantiomeric excess of at least 99 percent. Preferably the compounds of the invention have the "S" configuration at position 1. Also preferred are compounds that have the "R" configuration at position 2. Most preferred are compounds that have the "1S,2R" configuration.

25 All compound names were generated using ACD Namepro version 5.09, Chemdraw v. 6.02, or were derived therefrom.

Several of the compounds of formula (I) are amines, and as such form salts when reacted with acids. Pharmaceutically acceptable salts are preferred over the corresponding amines
30 since they produce compounds which are more water soluble, stable and/or more crystalline. Pharmaceutically acceptable salts are any salt which retains the activity of the parent compound and does not impart any deleterious or undesirable effect on the subject to whom it is administered and in the
35 context in which it is administered. Pharmaceutically acceptable salts include salts of both inorganic and organic

acids. The preferred pharmaceutically acceptable salts include salts of the following acids acetic, aspartic, benzenesulfonic, benzoic, bicarbonic, bisulfuric, bitartaric, butyric, calcium edetate, camsylic, carbonic, chlorobenzoic, citric, edetic, edisylic, estolic, esyl, esylic, formic, fumaric, gluceptic, gluconic, glutamic, glycollylarsanilic, hexamic, hexylresorcinoic, hydrabamic, hydrobromic, hydrochloric, hydroiodic, hydroxynaphthoic, isethionic, lactic, lactobionic, maleic, malic, malonic, mandelic, methanesulfonic, methylnitric, methylsulfuric, mucic, muconic, napsylic, nitric, oxalic, p-nitromethanesulfonic, pamoic, pantothenic, phosphoric, monohydrogen phosphoric, dihydrogen phosphoric, phthalic, polygalactouronic, propionic, salicylic, stearic, succinic, sulfamic, sulfanilic, sulfonic, sulfuric, tannic, tartaric, teoclic and toluenesulfonic. For other acceptable salts, see *Int. J. Pharm.*, 33, 201-217 (1986) and *J. Pharm. Sci.*, 66(1), 1, (1977).

The invention provides compounds, compositions, kits, and methods for inhibiting beta-secretase enzyme activity and A beta peptide production. Inhibition of beta-secretase enzyme activity halts or reduces the production of A beta from APP and reduces or eliminates the formation of beta-amyloid deposits in the brain.

Methods of the Invention

The compounds of the invention, and pharmaceutically acceptable salts thereof, are useful for treating humans or animals suffering from a condition characterized by a pathological form of beta-amyloid peptide, such as beta-amyloid plaques, and for helping to prevent or delay the onset of such a condition. For example, the compounds are useful for treating Alzheimer's disease, for helping prevent or delay the onset of Alzheimer's disease, for treating patients with MCI (mild cognitive impairment) and preventing or delaying the onset of Alzheimer's disease in those who would progress from

MCI to AD, for treating Down's syndrome, for treating humans who have Hereditary Cerebral Hemorrhage with Amyloidosis of the Dutch-Type, for treating cerebral amyloid angiopathy and preventing its potential consequences, i.e. single and
5 recurrent lobar hemorrhages, for treating other degenerative dementias, including dementias of mixed vascular and degenerative origin, dementia associated with Parkinson's disease, dementia associated with progressive supranuclear palsy, dementia associated with cortical basal degeneration,
10 and diffuse Lewy body type Alzheimer's disease. The compounds and compositions of the invention are particularly useful for treating or preventing Alzheimer's disease. When treating or preventing these diseases, the compounds of the invention can either be used individually or in combination, as is best for
15 the patient.

As used herein, the term "treating" means that the compounds of the invention can be used in humans with at least a tentative diagnosis of disease. The compounds of the invention will delay or slow the progression of the disease
20 thereby giving the individual a more useful life span.

The term "preventing" means that the compounds of the invention are useful when administered to a patient who has not been diagnosed as possibly having the disease at the time of administration, but who would normally be expected to
25 develop the disease or be at increased risk for the disease. The compounds of the invention will slow the development of disease symptoms, delay the onset of the disease, or prevent the individual from developing the disease at all. Preventing also includes administration of the compounds of the invention
30 to those individuals thought to be predisposed to the disease due to age, familial history, genetic or chromosomal abnormalities, and/or due to the presence of one or more biological markers for the disease, such as a known genetic mutation of APP or APP cleavage products in brain tissues or
35 fluids.

In treating or preventing the above diseases, the compounds of the invention are administered in a therapeutically effective amount. The therapeutically effective amount will vary depending on the particular compound used and the route of administration, as is known to those skilled in the art.

In treating a patient displaying any of the diagnosed above conditions a physician may administer a compound of the invention immediately and continue administration indefinitely, as needed. In treating patients who are not diagnosed as having Alzheimer's disease, but who are believed to be at substantial risk for Alzheimer's disease, the physician should preferably start treatment when the patient first experiences early pre-Alzheimer's symptoms such as, memory or cognitive problems associated with aging. In addition, there are some patients who may be determined to be at risk for developing Alzheimer's through the detection of a genetic marker such as APOE4 or other biological indicators that are predictive for Alzheimer's disease. In these situations, even though the patient does not have symptoms of the disease, administration of the compounds of the invention may be started before symptoms appear, and treatment may be continued indefinitely to prevent or delay the onset of the disease.

Dosage Forms and Amounts

The compounds of the invention can be administered orally, parenterally, (IV, IM, depo-IM, SQ, and depo SQ), sublingually, intranasally (inhalation), intrathecally, topically, or rectally. Dosage forms known to those of skill in the art are suitable for delivery of the compounds of the invention.

Compositions are provided that contain therapeutically effective amounts of the compounds of the invention. The compounds are preferably formulated into suitable

pharmaceutical preparations such as tablets, capsules, or elixirs for oral administration or in sterile solutions or suspensions for parenteral administration. Typically the compounds described above are formulated into pharmaceutical compositions using techniques and procedures well known in the art.

About 1 to 500 mg of a compound or mixture of compounds of the invention or a physiologically acceptable salt is compounded with a physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, flavor, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in those compositions or preparations is such that a suitable dosage in the range indicated is obtained. The compositions are preferably formulated in a unit dosage form, each dosage containing from about 2 to about 100 mg, more preferably about 10 to about 30 mg of the active ingredient. The term "unit dosage form" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

To prepare compositions, one or more compounds of the invention are mixed with a suitable pharmaceutically acceptable carrier. Upon mixing or addition of the compound(s), the resulting mixture may be a solution, suspension, emulsion, or the like. Liposomal suspensions may also be suitable as pharmaceutically acceptable carriers. These may be prepared according to methods known to those skilled in the art. The form of the resulting mixture depends upon a number of factors, including the intended mode of administration and the solubility of the compound in the selected carrier or vehicle. The effective concentration is sufficient for lessening or ameliorating at least one symptom of the disease, disorder, or condition treated and may be empirically determined.

Pharmaceutical carriers or vehicles suitable for administration of the compounds provided herein include any such carriers known to those skilled in the art to be suitable for the particular mode of administration. In addition, the
5 active materials can also be mixed with other active materials that do not impair the desired action, or with materials that supplement the desired action, or have another action. The compounds may be formulated as the sole pharmaceutically active ingredient in the composition or may be combined with
10 other active ingredients.

Where the compounds exhibit insufficient solubility, methods for solubilizing may be used. Such methods are known and include, but are not limited to, using cosolvents such as dimethylsulfoxide (DMSO), using surfactants such as Tween®,
15 and dissolution in aqueous sodium bicarbonate. Derivatives of the compounds, such as salts or prodrugs may also be used in formulating effective pharmaceutical compositions.

The concentration of the compound is effective for delivery of an amount upon administration that lessens or
20 ameliorates at least one symptom of the disorder for which the compound is administered. Typically, the compositions are formulated for single dosage administration.

The compounds of the invention may be prepared with carriers that protect them against rapid elimination from the
25 body, such as time-release formulations or coatings. Such carriers include controlled release formulations, such as, but not limited to, microencapsulated delivery systems. The active compound is included in the pharmaceutically acceptable carrier in an amount sufficient to exert a therapeutically
30 useful effect in the absence of undesirable side effects on the patient treated. The therapeutically effective concentration may be determined empirically by testing the compounds in known *in vitro* and *in vivo* model systems for the treated disorder.

The compounds and compositions of the invention can be enclosed in multiple or single dose containers. The enclosed compounds and compositions can be provided in kits, for example, including component parts that can be assembled for use. For example, a compound inhibitor in lyophilized form and a suitable diluent may be provided as separated components for combination prior to use. A kit may include a compound inhibitor and a second therapeutic agent for co-administration. The inhibitor and second therapeutic agent may be provided as separate component parts. A kit may include a plurality of containers, each container holding one or more unit dose of the compound of the invention. The containers are preferably adapted for the desired mode of administration, including, but not limited to tablets, gel capsules, sustained-release capsules, and the like for oral administration; depot products, pre-filled syringes, ampoules, vials, and the like for parenteral administration; and patches, medipads, creams, and the like for topical administration.

The concentration of active compound in the drug composition will depend on absorption, inactivation, and excretion rates of the active compound, the dosage schedule, and amount administered as well as other factors known to those of skill in the art.

The active ingredient may be administered at once, or may be divided into a number of smaller doses to be administered at intervals of time. It is understood that the precise dosage and duration of treatment is a function of the disease being treated and may be determined empirically using known testing protocols or by extrapolation from *in vivo* or *in vitro* test data. It is to be noted that concentrations and dosage values may also vary with the severity of the condition to be alleviated. It is to be further understood that for any particular subject, specific dosage regimens should be adjusted over time according to the individual need and the

professional judgment of the person administering or supervising the administration of the compositions, and that the concentration ranges set forth herein are exemplary only and are not intended to limit the scope or practice of the
5 claimed compositions.

If oral administration is desired, the compound should be provided in a composition that protects it from the acidic environment of the stomach. For example, the composition can be formulated in an enteric coating that maintains its
10 integrity in the stomach and releases the active compound in the intestine. The composition may also be formulated in combination with an antacid or other such ingredient.

Oral compositions will generally include an inert diluent or an edible carrier and may be compressed into tablets or enclosed in gelatin capsules. For the purpose of oral
15 therapeutic administration, the active compound or compounds can be incorporated with excipients and used in the form of tablets, capsules, or troches. Pharmaceutically compatible binding agents and adjuvant materials can be included as part
20 of the composition.

The tablets, pills, capsules, troches, and the like can contain any of the following ingredients or compounds of a similar nature: a binder such as, but not limited to, gum tragacanth, acacia, corn starch, or gelatin; an excipient such
25 as microcrystalline cellulose, starch, or lactose; a disintegrating agent such as, but not limited to, alginic acid and corn starch; a lubricant such as, but not limited to, magnesium stearate; a gildant, such as, but not limited to, colloidal silicon dioxide; a sweetening agent such as sucrose
30 or saccharin; and a flavoring agent such as peppermint, methyl salicylate, or fruit flavoring.

When the dosage unit form is a capsule, it can contain, in addition to material of the above type, a liquid carrier such as a fatty oil. In addition, dosage unit forms can
35 contain various other materials, which modify the physical form of the dosage unit, for example, coatings of sugar and

other enteric agents. The compounds can also be administered as a component of an elixir, suspension, syrup, wafer, chewing gum or the like. A syrup may contain, in addition to the active compounds, sucrose as a sweetening agent and certain
5 preservatives, dyes and colorings, and flavors.

The active materials can also be mixed with other active materials that do not impair the desired action, or with materials that supplement the desired action.

Solutions or suspensions used for parenteral,
10 intradermal, subcutaneous, or topical application can include any of the following components: a sterile diluent such as water for injection, saline solution, fixed oil, a naturally occurring vegetable oil such as sesame oil, coconut oil, peanut oil, cottonseed oil, and the like, or a synthetic fatty
15 vehicle such as ethyl oleate, and the like, polyethylene glycol, glycerine, propylene glycol, or other synthetic solvent; antimicrobial agents such as benzyl alcohol and methyl parabens; antioxidants such as ascorbic acid and sodium bisulfite; chelating agents such as ethylenediaminetetraacetic
20 acid (EDTA); buffers such as acetates, citrates, and phosphates; and agents for the adjustment of tonicity such as sodium chloride and dextrose. Parenteral preparations can be enclosed in ampoules, disposable syringes, or multiple dose vials made of glass, plastic, or other suitable material.
25 Buffers, preservatives, antioxidants, and the like can be incorporated as required.

Where administered intravenously, suitable carriers include physiological saline, phosphate buffered saline (PBS), and solutions containing thickening and solubilizing agents
30 such as glucose, polyethylene glycol, polypropyleneglycol, and mixtures thereof. Liposomal suspensions including tissue-targeted liposomes may also be suitable as pharmaceutically acceptable carriers. These may be prepared according to methods known for example, as described in U.S. Patent No.
35 4,522,811.

The active compounds may be prepared with carriers that protect the compound against rapid elimination from the body, such as time-release formulations or coatings. Such carriers include controlled release formulations, such as, but not
5 limited to, implants and microencapsulated delivery systems, and biodegradable, biocompatible polymers such as collagen, ethylene vinyl acetate, polyanhydrides, polyglycolic acid, polyorthoesters, polylactic acid, and the like. Methods for preparation of such formulations are known to those in the
10 art.

The compounds of the invention can be administered orally, parenterally (IV, IM, depo-IM, SQ, and depo-SQ), sublingually, intranasally (inhalation), intrathecally, topically, or rectally. Dosage forms known to those skilled
15 in the art are suitable for delivery of the compounds of the invention.

Compounds of the invention may be administered enterally or parenterally. When administered orally, compounds of the invention can be administered in usual dosage forms for oral
20 administration as is well known to those skilled in the art. These dosage forms include the usual solid unit dosage forms of tablets and capsules as well as liquid dosage forms such as solutions, suspensions, and elixirs. When the solid dosage forms are used, it is preferred that they be of the sustained
25 release type so that the compounds of the invention need to be administered only once or twice daily.

The oral dosage forms are administered to the patient 1, 2, 3, or 4 times daily. It is preferred that the compounds of the invention be administered either three or fewer times,
30 more preferably once or twice daily. Hence, it is preferred that the compounds of the invention be administered in oral dosage form. It is preferred that whatever oral dosage form is used, that it be designed so as to protect the compounds of the invention from the acidic environment of the stomach.
35 Enteric coated tablets are well known to those skilled in the art. In addition, capsules filled with small spheres each

coated to protect from the acidic stomach, are also well known to those skilled in the art.

When administered orally, an administered amount therapeutically effective to inhibit beta-secretase activity, to inhibit A beta production, to inhibit A beta deposition, or to treat or prevent AD is from about 0.1 mg/day to about 1,000 mg/day. It is preferred that the oral dosage is from about 1 mg/day to about 100 mg/day. It is more preferred that the oral dosage is from about 5 mg/day to about 50 mg/day. It is understood that while a patient may be started at one dose, that dose may be varied over time as the patient's condition changes.

Compounds of the invention may also be advantageously delivered in a nano crystal dispersion formulation. Preparation of such formulations is described, for example, in U.S. Patent 5,145,684. Nano crystalline dispersions of HIV protease inhibitors and their method of use are described in U.S. Patent No. 6,045,829. The nano crystalline formulations typically afford greater bioavailability of drug compounds.

The compounds of the invention can be administered parenterally, for example, by IV, IM, depo-IM, SC, or depo-SC. When administered parenterally, a therapeutically effective amount of about 0.5 to about 100 mg/day, preferably from about 5 to about 50 mg daily should be delivered. When a depot formulation is used for injection once a month or once every two weeks, the dose should be about 0.5 mg/day to about 50 mg/day, or a monthly dose of from about 15 mg to about 1,500 mg. In part because of the forgetfulness of the patients with Alzheimer's disease, it is preferred that the parenteral dosage form be a depo formulation.

The compounds of the invention can be administered sublingually. When given sublingually, the compounds of the invention should be given one to four times daily in the amounts described above for IM administration.

The compounds of the invention can be administered intranasally. When given by this route, the appropriate

dosage forms are a nasal spray or dry powder, as is known to those skilled in the art. The dosage of the compounds of the invention for intranasal administration is the amount described above for IM administration.

5 The compounds of the invention can be administered intrathecally. When given by this route the appropriate dosage form can be a parenteral dosage form as is known to those skilled in the art. The dosage of the compounds of the invention for intrathecal administration is the amount
10 described above for IM administration.

 The compounds of the invention can be administered topically. When given by this route, the appropriate dosage form is a cream, ointment, or patch. Because of the amount of the compounds of the invention to be administered, the patch
15 is preferred. When administered topically, the dosage is from about 0.5 mg/day to about 200 mg/day. Because the amount that can be delivered by a patch is limited, two or more patches may be used. The number and size of the patch is not important, what is important is that a therapeutically
20 effective amount of the compounds of the invention be delivered as is known to those skilled in the art. The compounds of the invention can be administered rectally by suppository as is known to those skilled in the art. When administered by suppository, the therapeutically effective
25 amount is from about 0.5 mg to about 500 mg.

 The compounds of the invention can be administered by implants as is known to those skilled in the art. When administering a compound of the invention by implant, the therapeutically effective amount is the amount described above
30 for depot administration.

 Given a particular compound of the invention and a desired dosage form, one skilled in the art would know how to prepare and administer the appropriate dosage form.

 The compounds of the invention are used in the same
35 manner, by the same routes of administration, using the same pharmaceutical dosage forms, and at the same dosing schedule

as described above, for preventing disease or treating patients with MCI (mild cognitive impairment) and preventing or delaying the onset of Alzheimer's disease in those who would progress from MCI to AD, for treating or preventing
5 Down's syndrome, for treating humans who have Hereditary Cerebral Hemorrhage with Amyloidosis of the Dutch-Type, for treating cerebral amyloid angiopathy and preventing its potential consequences, i.e. single and recurrent lobar hemorrhages, for treating other degenerative dementias,
10 including dementias of mixed vascular and degenerative origin, dementia associated with Parkinson's disease, dementia associated with progressive supranuclear palsy, dementia associated with cortical basal degeneration, and diffuse Lewy body type of Alzheimer's disease.

15 The compounds of the invention can be used in combination, with each other or with other therapeutic agents or approaches used to treat or prevent the conditions listed above. Such agents or approaches include: acetylcholine esterase inhibitors such as tacrine (tetrahydroaminoacridine,
20 marketed as COGNEX®), donepezil hydrochloride, (marketed as Aricept® and rivastigmine (marketed as Exelon®); gamma-secretase inhibitors; anti-inflammatory agents such as cyclooxygenase II inhibitors; anti-oxidants such as Vitamin E and ginkgolides; immunological approaches, such as, for
25 example, immunization with A beta peptide or administration of anti-A beta peptide antibodies; statins; and direct or indirect neurotropic agents such as Cerebrolysin®, AIT-082 (Emilieu, 2000, Arch. Neurol. 57:454), and other neurotropic agents of the future.

30 In addition, the compounds of formula (I) can also be used with inhibitors of P-glycoprotein (P-gp). P-gp inhibitors and the use of such compounds are known to those skilled in the art. See for example, *Cancer Research*, 53, 4595-4602 (1993), *Clin. Cancer Res.*, 2, 7-12 (1996), *Cancer*
35 *Research*, 56, 4171-4179 (1996), International Publications

WO99/64001 and WO01/10387. The important thing is that the blood level of the P-gp inhibitor be such that it exerts its effect in inhibiting P-gp from decreasing brain blood levels of the compounds of formula (A). To that end the P-gp inhibitor and the compounds of formula (A) can be administered at the same time, by the same or different route of administration, or at different times. The important thing is not the time of administration but having an effective blood level of the P-gp inhibitor.

Suitable P-gp inhibitors include cyclosporin A, verapamil, tamoxifen, quinidine, Vitamin E-TGPS, ritonavir, megestrol acetate, progesterone, rapamycin, 10,11-methanodibenzosuberane, phenothiazines, acridine derivatives such as GF120918, FK506, VX-710, LY335979, PSC-833, GF-102,918 and other steroids. It is to be understood that additional agents will be found that have the same function and therefore achieve the same outcome; such compounds are also considered to be useful.

The P-gp inhibitors can be administered orally, parenterally, (IV, IM, IM-depo, SQ, SQ-depo), topically, sublingually, rectally, intranasally, intrathecally and by implant.

The therapeutically effective amount of the P-gp inhibitors is from about 0.1 to about 300 mg/kg/day, preferably about 0.1 to about 150 mg/kg daily. It is understood that while a patient may be started on one dose, that dose may have to be varied over time as the patient's condition changes.

When administered orally, the P-gp inhibitors can be administered in usual dosage forms for oral administration as is known to those skilled in the art. These dosage forms include the usual solid unit dosage forms of tablets and capsules as well as liquid dosage forms such as solutions, suspensions and elixirs. When the solid dosage forms are used, it is preferred that they be of the sustained release type so that the P-gp inhibitors need to be administered only

once or twice daily. The oral dosage forms are administered to the patient one thru four times daily. It is preferred that the P-gp inhibitors be administered either three or fewer times a day, more preferably once or twice daily. Hence, it is preferred that the P-gp inhibitors be administered in solid dosage form and further it is preferred that the solid dosage form be a sustained release form which permits once or twice daily dosing. It is preferred that what ever dosage form is used, that it be designed so as to protect the P-gp inhibitors from the acidic environment of the stomach. Enteric coated tablets are well known to those skilled in the art. In addition, capsules filled with small spheres each coated to protect from the acidic stomach, are also well known to those skilled in the art.

In addition, the P-gp inhibitors can be administered parenterally. When administered parenterally they can be administered IV, IM, depo-IM, SQ or depo-SQ.

The P-gp inhibitors can be given sublingually. When given sublingually, the P-gp inhibitors should be given one thru four times daily in the same amount as for IM administration.

The P-gp inhibitors can be given intranasally. When given by this route of administration, the appropriate dosage forms are a nasal spray or dry powder as is known to those skilled in the art. The dosage of the P-gp inhibitors for intranasal administration is the same as for IM administration.

The P-gp inhibitors can be given intrathecally. When given by this route of administration the appropriate dosage form can be a parenteral dosage form as is known to those skilled in the art.

The P-gp inhibitors can be given topically. When given by this route of administration, the appropriate dosage form is a cream, ointment or patch. Because of the amount of the P-gp inhibitors needed to be administered the patch is preferred. However, the amount that can be delivered by a

patch is limited. Therefore, two or more patches may be required. The number and size of the patch is not important, what is important is that a therapeutically effective amount of the P-gp inhibitors be delivered as is known to those skilled in the art.

The P-gp inhibitors can be administered rectally by suppository or by implants, both of which are known to those skilled in the art.

There is nothing novel about the route of administration nor the dosage forms for administering the P-gp inhibitors. Given a particular P-gp inhibitor, and a desired dosage form, one skilled in the art would know how to prepare the appropriate dosage form for the P-gp inhibitor.

It should be apparent to one skilled in the art that the exact dosage and frequency of administration will depend on the particular compounds of the invention administered, the particular condition being treated, the severity of the condition being treated, the age, weight, general physical condition of the particular patient, and other medication the individual may be taking as is well known to administering physicians who are skilled in this art.

Inhibition of APP Cleavage

The compounds of the invention inhibit cleavage of APP between Met595 and Asp596 numbered for the APP695 isoform, or a mutant thereof, or at a corresponding site of a different isoform, such as APP751 or APP770, or a mutant thereof (sometimes referred to as the "beta secretase site"). While not wishing to be bound by a particular theory, inhibition of beta-secretase activity is thought to inhibit production of beta amyloid peptide (A beta). Inhibitory activity is demonstrated in one of a variety of inhibition assays, whereby cleavage of an APP substrate in the presence of a beta-secretase enzyme is analyzed in the presence of the inhibitory compound, under conditions normally sufficient to result in

cleavage at the beta-secretase cleavage site. Reduction of APP cleavage at the beta-secretase cleavage site compared with an untreated or inactive control is correlated with inhibitory activity. Assay systems that can be used to demonstrate efficacy of the compound inhibitors of the invention are known. Representative assay systems are described, for example, in U.S. Patents No. 5,942,400, 5,744,346, as well as in the Examples below.

The enzymatic activity of beta-secretase and the production of A beta can be analyzed *in vitro* or *in vivo*, using natural, mutated, and/or synthetic APP substrates, natural, mutated, and/or synthetic enzyme, and the test compound. The analysis may involve primary or secondary cells expressing native, mutant, and/or synthetic APP and enzyme, animal models expressing native APP and enzyme, or may utilize transgenic animal models expressing the substrate and enzyme. Detection of enzymatic activity can be by analysis of one or more of the cleavage products, for example, by immunoassay, fluorometric or chromogenic assay, HPLC, or other means of detection. Inhibitory compounds are determined as those having the ability to decrease the amount of beta-secretase cleavage product produced in comparison to a control, where beta-secretase mediated cleavage in the reaction system is observed and measured in the absence of inhibitory compounds.

Beta-Secretase

Various forms of beta-secretase enzyme are known, and are available and useful for assay of enzyme activity and inhibition of enzyme activity. These include native, recombinant, and synthetic forms of the enzyme. Human beta-secretase is known as Beta Site APP Cleaving Enzyme (BACE), Asp2, and memapsin 2, and has been characterized, for example, in U.S. Patent No. 5,744,346 and published PCT patent applications WO98/22597, WO00/03819, WO01/23533, and WO00/17369, as well as in literature publications (Hussain et

al., 1999, *Mol. Cell. Neurosci.* 14:419-427; Vassar et al., 1999, *Science* 286:735-741; Yan et al., 1999, *Nature* 402:533-537; Sinha et al., 1999, *Nature* 40:537-540; and Lin et al., 2000, *PNAS USA* 97:1456-1460). Synthetic forms of the enzyme
5 have also been described (WO98/22597 and WO00/17369). Beta-secretase can be extracted and purified from human brain tissue and can be produced in cells, for example mammalian cells expressing recombinant enzyme.

Preferred compounds are effective to inhibit 50% of beta-secretase enzymatic activity at a concentration of less than
10 50 micromolar, preferably at a concentration of 10 micromolar or less, more preferably 1 micromolar or less, and most preferably 10 nanomolar or less.

15 APP Substrate

Assays that demonstrate inhibition of beta-secretase-mediated cleavage of APP can utilize any of the known forms of APP, including the 695 amino acid "normal" isotype described by Kang et al., 1987, *Nature* 325:733-6, the 770 amino acid
20 isotype described by Kitaguchi et. al., 1981, *Nature* 331:530-532, and variants such as the Swedish Mutation (KM670-1NL) (APP-SW), the London Mutation (V7176F), and others. See, for example, U.S. Patent No. 5,766,846 and also Hardy, 1992, *Nature Genet.* 1:233-234, for a review of known variant
25 mutations. Additional useful substrates include the dibasic amino acid modification, APP-KK disclosed, for example, in WO 00/17369, fragments of APP, and synthetic peptides containing the beta-secretase cleavage site, wild type (WT) or mutated form, e.g., SW, as described, for example, in U.S. Patent No
30 5,942,400 and WO00/03819.

The APP substrate contains the beta-secretase cleavage site of APP (KM-DA or NL-DA) for example, a complete APP peptide or variant, an APP fragment, a recombinant or synthetic APP, or a fusion peptide. Preferably, the fusion
35 peptide includes the beta-secretase cleavage site fused to a

peptide having a moiety useful for enzymatic assay, for example, having isolation and/or detection properties. A useful moiety may be an antigenic epitope for antibody binding, a label or other detection moiety, a binding substrate, and the like.

Antibodies

Products characteristic of APP cleavage can be measured by immunoassay using various antibodies, as described, for example, in Pirttila et al., 1999, *Neuro. Lett.* 249:21-4, and in U.S. Patent No. 5,612,486. Useful antibodies to detect A beta include, for example, the monoclonal antibody 6E10 (Senetek, St. Louis, MO) that specifically recognizes an epitope on amino acids 1-16 of the A beta peptide; antibodies 162 and 164 (New York State Institute for Basic Research, Staten Island, NY) that are specific for human A beta 1-40 and 1-42, respectively; and antibodies that recognize the junction region of beta-amyloid peptide, the site between residues 16 and 17, as described in U.S. Patent No. 5,593,846. Antibodies raised against a synthetic peptide of residues 591 to 596 of APP and SW192 antibody raised against 590-596 of the Swedish mutation are also useful in immunoassay of APP and its cleavage products, as described in U.S. Patent Nos. 5,604,102 and 5,721,130.

Assay Systems

Assays for determining APP cleavage at the beta-secretase cleavage site are well known in the art. Exemplary assays, are described, for example, in U.S. Patent Nos. 5,744,346 and 5,942,400, and described in the Examples below.

Cell Free Assays

Exemplary assays that can be used to demonstrate the inhibitory activity of the compounds of the invention are described, for example, in WO00/17369, WO 00/03819, and U.S.

Patents No. 5,942,400 and 5,744,346. Such assays can be performed in cell-free incubations or in cellular incubations using cells expressing a beta-secretase and an APP substrate having a beta-secretase cleavage site.

5 An APP substrate containing the beta-secretase cleavage site of APP, for example, a complete APP or variant, an APP fragment, or a recombinant or synthetic APP substrate containing the amino acid sequence: KM-DA or NL-DA, is incubated in the presence of beta-secretase enzyme, a
10 fragment thereof, or a synthetic or recombinant polypeptide variant having beta-secretase activity and effective to cleave the beta-secretase cleavage site of APP, under incubation conditions suitable for the cleavage activity of the enzyme. Suitable substrates optionally include derivatives that may be
15 fusion proteins or peptides that contain the substrate peptide and a modification useful to facilitate the purification or detection of the peptide or its beta-secretase cleavage products. Useful modifications include the insertion of a known antigenic epitope for antibody binding; the linking of a
20 label or detectable moiety, the linking of a binding substrate, and the like.

Suitable incubation conditions for a cell-free *in vitro* assay include, for example: approximately 200 nanomolar to 10 micromolar substrate, approximately 10 to 200 picomolar
25 enzyme, and approximately 0.1 nanomolar to 10 micromolar inhibitor compound, in aqueous solution, at an approximate pH of 4-7, at approximately 37 degrees C, for a time period of approximately 10 minutes to 3 hours. These incubation conditions are exemplary only, and can be varied as required
30 for the particular assay components and/or desired measurement system. Optimization of the incubation conditions for the particular assay components should account for the specific beta-secretase enzyme used and its pH optimum, any additional enzymes and/or markers that might be used in the assay, and

the like. Such optimization is routine and will not require undue experimentation.

One useful assay utilizes a fusion peptide having maltose binding protein (MBP) fused to the C-terminal 125 amino acids of APP-SW. The MBP portion is captured on an assay substrate by anti-MBP capture antibody. Incubation of the captured fusion protein in the presence of beta-secretase results in cleavage of the substrate at the beta-secretase cleavage site. Analysis of the cleavage activity can be, for example, by immunoassay of cleavage products. One such immunoassay detects a unique epitope exposed at the carboxy terminus of the cleaved fusion protein, for example, using the antibody SW192. This assay is described, for example, in U.S. Patent No 5,942,400.

Cellular Assay

Numerous cell-based assays can be used to analyze beta-secretase activity and/or processing of APP to release A beta. Contact of an APP substrate with a beta-secretase enzyme within the cell and in the presence or absence of a compound inhibitor of the invention can be used to demonstrate beta-secretase inhibitory activity of the compound. Preferably, assay in the presence of a useful inhibitory compound provides at least about 30%, most preferably at least about 50% inhibition of the enzymatic activity, as compared with a non-inhibited control.

In one embodiment, cells that naturally express beta-secretase are used. Alternatively, cells are modified to express a recombinant beta-secretase or synthetic variant enzyme as discussed above. The APP substrate may be added to the culture medium and is preferably expressed in the cells. Cells that naturally express APP, variant or mutant forms of APP, or cells transformed to express an isoform of APP, mutant or variant APP, recombinant or synthetic APP, APP fragment, or synthetic APP peptide or fusion protein containing the beta-

secretase APP cleavage site can be used, provided that the expressed APP is permitted to contact the enzyme and enzymatic cleavage activity can be analyzed.

Human cell lines that normally process A beta from APP provide a useful means to assay inhibitory activities of the compounds of the invention. Production and release of A beta and/or other cleavage products into the culture medium can be measured, for example by immunoassay, such as Western blot or enzyme-linked immunoassay (EIA) such as by ELISA.

Cells expressing an APP substrate and an active beta-secretase can be incubated in the presence of a compound inhibitor to demonstrate inhibition of enzymatic activity as compared with a control. Activity of beta-secretase can be measured by analysis of one or more cleavage products of the APP substrate. For example, inhibition of beta-secretase activity against the substrate APP would be expected to decrease release of specific beta-secretase induced APP cleavage products such as A beta.

Although both neural and non-neural cells process and release A beta, levels of endogenous beta-secretase activity are low and often difficult to detect by EIA. The use of cell types known to have enhanced beta-secretase activity, enhanced processing of APP to A beta, and/or enhanced production of A beta are therefore preferred. For example, transfection of cells with the Swedish Mutant form of APP (APP-SW); with APP-KK; or with APP-SW-KK provides cells having enhanced beta-secretase activity and producing amounts of A beta that can be readily measured.

In such assays, for example, the cells expressing APP and beta-secretase are incubated in a culture medium under conditions suitable for beta-secretase enzymatic activity at its cleavage site on the APP substrate. On exposure of the cells to the compound inhibitor, the amount of A beta released into the medium and/or the amount of CTF99 fragments of APP in the cell lysates is reduced as compared with the control. The

cleavage products of APP can be analyzed, for example, by immune reactions with specific antibodies, as discussed above.

Preferred cells for analysis of beta-secretase activity include primary human neuronal cells, primary transgenic
5 animal neuronal cells where the transgene is APP, and other cells such as those of a stable 293 cell line expressing APP, for example, APP-SW.

In vivo Assays: Animal Models

10 Various animal models can be used to analyze beta-secretase activity and /or processing of APP to release A beta, as described above. For example, transgenic animals expressing APP substrate and beta-secretase enzyme can be used to demonstrate inhibitory activity of the compounds of the
15 invention. Certain transgenic animal models have been described, for example, in U.S. Patent Nos.: 5,877,399; 5,612,486; 5,387,742; 5,720,936; 5,850,003; 5,877,015,, and 5,811,633, and in Ganes et al., 1995, *Nature* 373:523. Preferred are animals that exhibit characteristics associated
20 with the pathophysiology of AD. Administration of the compound inhibitors of the invention to the transgenic mice described herein provides an alternative method for demonstrating the inhibitory activity of the compounds. Administration of the compounds in a pharmaceutically
25 effective carrier and via an administrative route that reaches the target tissue in an appropriate therapeutic amount is also preferred.

Inhibition of beta-secretase mediated cleavage of APP at the beta-secretase cleavage site and of A beta release can be
30 analyzed in these animals by measure of cleavage fragments in the animal's body fluids such as cerebral fluid or tissues. Analysis of brain tissues for A beta deposits or plaques is preferred.

On contacting an APP substrate with a beta-secretase
35 enzyme in the presence of an inhibitory compound of the

invention and under conditions sufficient to permit enzymatic mediated cleavage of APP and/or release of A beta from the substrate, the compounds of the invention are effective to reduce beta-secretase-mediated cleavage of APP at the beta-secretase cleavage site and/or effective to reduce released amounts of A beta. Where such contacting is the administration of the inhibitory compounds of the invention to an animal model, for example, as described above, the compounds are effective to reduce A beta deposition in brain tissues of the animal, and to reduce the number and/or size of beta amyloid plaques. Where such administration is to a human subject, the compounds are effective to inhibit or slow the progression of disease characterized by enhanced amounts of A beta, to slow the progression of AD in the, and/or to prevent onset or development of AD in a patient at risk for the disease.

Definitions

The definitions and explanations below are for the terms as used throughout this entire document including both the specification and the claims:

It should be noted that, as used in this specification and the appended claims, the singular forms "a," "an," and "the" include plural referents unless the content clearly dictates otherwise. Thus, for example, reference to a composition containing "a compound" includes a mixture of two or more compounds. It should also be noted that the term "or" is generally employed in its sense including "and/or" unless the content clearly dictates otherwise.

Where multiple substituents are indicated as being attached to a structure, it is to be understood that the substituents can be the same or different. Thus for example "R_m optionally substituted with 1, 2 or 3 R_q groups" indicates
5 that R_m is substituted with 1, 2, or 3 R_q groups where the R_q groups can be the same or different.

BIOLOGY EXAMPLES

Example A

5 Enzyme Inhibition Assay

The compounds of the invention are analyzed for inhibitory activity by use of the MBP-C125 assay. This assay determines the relative inhibition of beta-secretase cleavage of a model APP substrate, MBP-C125SW, by the compounds assayed
10 as compared with an untreated control. A detailed description of the assay parameters can be found, for example, in U.S. Patent No. 5,942,400. Briefly, the substrate is a fusion peptide formed of maltose binding protein (MBP) and the carboxy terminal 125 amino acids of APP-SW, the Swedish
15 mutation. The beta-secretase enzyme is derived from human brain tissue as described in Sinha et al, 1999, Nature 40:537-540) or recombinantly produced as the full-length enzyme (amino acids 1-501), and can be prepared, for example, from 293 cells expressing the recombinant cDNA, as described in
20 WO00/47618.

Inhibition of the enzyme is analyzed, for example, by immunoassay of the enzyme's cleavage products. One exemplary ELISA uses an anti-MBP capture antibody that is deposited on precoated and blocked 96-well high binding plates, followed by
25 incubation with diluted enzyme reaction supernatant, incubation with a specific reporter antibody, for example, biotinylated anti-SW192 reporter antibody, and further incubation with streptavidin/alkaline phosphatase. In the assay, cleavage of the intact MBP-C125SW fusion protein
30 results in the generation of a truncated amino-terminal fragment, exposing a new SW-192 antibody-positive epitope at the carboxy terminus. Detection is effected by a fluorescent substrate signal on cleavage by the phosphatase. ELISA only detects cleavage following Leu 596 at the substrate's APP-SW
35 751 mutation site.

Specific Assay Procedure:

Compounds are diluted in a 1:1 dilution series to a six-point concentration curve (two wells per concentration) in one 5 96-plate row per compound tested. Each of the test compounds is prepared in DMSO to make up a 10 millimolar stock solution. The stock solution is serially diluted in DMSO to obtain a final compound concentration of 200 micromolar at the high point of a 6-point dilution curve. Ten (10) microliters of 10 each dilution is added to each of two wells on row C of a corresponding V-bottom plate to which 190 microliters of 52 millimolar NaOAc, 7.9% DMSO, pH 4.5 are pre-added. The NaOAc diluted compound plate is spun down to pellet precipitant and 20 microliters/well is transferred to a corresponding flat- 15 bottom plate to which 30 microliters of ice-cold enzyme-substrate mixture (2.5 microliters MBP-C125SW substrate, 0.03 microliters enzyme and 24.5 microliters ice cold 0.09% TX100 per 30 microliters) is added. The final reaction mixture of 200 micromolar compound at the highest curve point is in 5% 20 DMSO, 20 millimolar NaOAc, 0.06% TX100, at pH 4.5.

Warming the plates to 37 degrees C starts the enzyme reaction. After 90 minutes at 37 degrees C, 200 microliters/well cold specimen diluent is added to stop the reaction and 20 microliters/well was transferred to a 25 corresponding anti-MBP antibody coated ELISA plate for capture, containing 80 microliters/well specimen diluent. This reaction is incubated overnight at 4 degrees C and the ELISA is developed the next day after a 2 hour incubation with anti-192SW antibody, followed by Streptavidin-AP conjugate and 30 fluorescent substrate. The signal is read on a fluorescent plate reader.

Relative compound inhibition potency is determined by calculating the concentration of compound that showed a fifty percent reduction in detected signal (IC_{50}) compared to the 35 enzyme reaction signal in the control wells with no added

compound. In this assay, preferred compounds of the invention exhibit an IC₅₀ of less than 50 micromolar.

5 Cell Free Inhibition Assay Utilizing a Synthetic APP Substrate

A synthetic APP substrate that can be cleaved by beta-secretase and having N-terminal biotin and made fluorescent by the covalent attachment of Oregon green at the Cys residue is
10 used to assay beta-secretase activity in the presence or absence of the inhibitory compounds of the invention. Useful substrates include the following:

The enzyme (0.1 nanomolar) and test compounds (0.001-100 micromolar) are incubated in pre-blocked, low affinity, black plates (384 well) at 37 degrees for 30 minutes. The reaction
30 is initiated by addition of 150 millimolar substrate to a final volume of 30 microliter per well. The final assay conditions are: 0.001-100 micromolar compound inhibitor; 0.1 molar sodium acetate (pH 4.5); 150 nanomolar substrate; 0.1 nanomolar soluble beta-secretase; 0.001% Tween 20, and 2%
35 DMSO. The assay mixture is incubated for 3 hours at 37

degrees C, and the reaction is terminated by the addition of a saturating concentration of immunopure streptavidin. After incubation with streptavidin at room temperature for 15 minutes, fluorescence polarization is measured, for example, using a LJL Acquest (Ex485 nm/ Em530 nm). The activity of the beta-secretase enzyme is detected by changes in the fluorescence polarization that occur when the substrate is cleaved by the enzyme. Incubation in the presence or absence of compound inhibitor demonstrates specific inhibition of beta-secretase enzymatic cleavage of its synthetic APP substrate. In this assay, preferred compounds of the invention exhibit an IC_{50} of less than 50 micromolar. More preferred compounds of the invention exhibit an IC_{50} of less than 10 micromolar. Even more preferred compounds of the invention exhibit an IC_{50} of less than 5 micromolar.

Example C

Beta-Secretase Inhibition: P26-P4'SW Assay

Synthetic substrates containing the beta-secretase cleavage site of APP are used to assay beta-secretase activity, using the methods described, for example, in published PCT application WO00/47618. The P26-P4'SW substrate is a peptide of the sequence:

(biotin)CGGADRGLTTRPGSGLTNIKTEEISEVNLDAEF [SEQ ID NO: 6]

The P26-P1 standard has the sequence:

(biotin)CGGADRGLTTRPGSGLTNIKTEEISEVNL [SEQ ID NO: 7].

Briefly, the biotin-coupled synthetic substrates are incubated at a concentration of from about 0 to about 200 micromolar in this assay. When testing inhibitory compounds, a substrate concentration of about 1.0 micromolar is preferred. Test compounds diluted in DMSO are added to the reaction mixture, with a final DMSO concentration of 5%. Controls also contain a final DMSO concentration of 5%. The

concentration of beta secretase enzyme in the reaction is varied, to give product concentrations with the linear range of the ELISA assay, about 125 to 2000 picomolar, after dilution.

5 The reaction mixture also includes 20 millimolar sodium acetate, pH 4.5, 0.06% Triton X100, and is incubated at 37 degrees C for about 1 to 3 hours. Samples are then diluted in assay buffer (for example, 145.4 nanomolar sodium chloride, 9.51 millimolar sodium phosphate, 7.7 millimolar sodium azide,
10 0.05% Triton X405, 6g/liter bovine serum albumin, pH 7.4) to quench the reaction, then diluted further for immunoassay of the cleavage products.

Cleavage products can be assayed by ELISA. Diluted samples and standards are incubated in assay plates coated
15 with capture antibody, for example, SW192, for about 24 hours at 4 degrees C. After washing in TTBS buffer (150 millimolar sodium chloride, 25 millimolar Tris, 0.05% Tween 20, pH 7.5), the samples are incubated with streptavidin-AP according to the manufacturer's instructions. After a one hour incubation
20 at room temperature, the samples are washed in TTBS and incubated with fluorescent substrate solution A (31.2 g/liter 2-amino-2-methyl-1-propanol, 30 mg/liter, pH 9.5). Reaction with streptavidin-alkaline phosphate permits detection by fluorescence. Compounds that are effective inhibitors of
25 beta-secretase activity demonstrate reduced cleavage of the substrate as compared to a control.

Example D

Assays using Synthetic Oligopeptide-Substrates

30 Synthetic oligopeptides are prepared that incorporate the known cleavage site of beta-secretase, and optionally detectable tags, such as fluorescent or chromogenic moieties. Examples of such peptides, as well as their production and detection methods are described in U.S. Patent No: 5,942,400,
35 herein incorporated by reference. Cleavage products can be

detected using high performance liquid chromatography, or fluorescent or chromogenic detection methods appropriate to the peptide to be detected, according to methods well known in the art.

5 By way of example, one such peptide has the sequence SEVNL-DAEF [SEQ ID NO: 8], and the cleavage site is between residues 5 and 6. Another preferred substrate has the sequence ADRGLTTRPGSGLTNIKTEEISEVNL-DAEF [SEQ ID NO: 9], and the cleavage site is between residues 26 and 27.

10 These synthetic APP substrates are incubated in the presence of beta-secretase under conditions sufficient to result in beta-secretase mediated cleavage of the substrate. Comparison of the cleavage results in the presence of the compound inhibitor to control results provides a measure of
15 the compound's inhibitory activity.

Example E

Inhibition of Beta-Secretase Activity - Cellular Assay

An exemplary assay for the analysis of inhibition of
20 beta-secretase activity utilizes the human embryonic kidney cell line HEKp293 (ATCC Accession No. CRL-1573) transfected with APP751 containing the naturally occurring double mutation Lys651Met52 to Asn651Leu652 (numbered for APP751), commonly called the Swedish mutation and shown to overproduce A beta
25 (Citron et al., 1992, Nature 360:672-674), as described in U.S. Patent No. 5,604,102.

The cells are incubated in the presence/absence of the inhibitory compound (diluted in DMSO) at the desired concentration, generally up to 10 micrograms/ml. At the end
30 of the treatment period, conditioned media is analyzed for beta-secretase activity, for example, by analysis of cleavage fragments. A beta can be analyzed by immunoassay, using specific detection antibodies. The enzymatic activity is measured in the presence and absence of the compound

inhibitors to demonstrate specific inhibition of beta-secretase mediated cleavage of APP substrate.

30 daily for a period of days. Beginning at time 0, brain tissue or cerebral fluid is obtained from selected animals and analyzed for the presence of APP cleavage peptides, including A beta, for example, by immunoassay using specific antibodies for A beta detection. At the end of the test period, animals
35 are sacrificed and brain tissue or cerebral fluid is analyzed
